Since I am STILL in service & have never been discharged there is no
way I could have a DD-214 or any Discharge paperwork.

So then you think I might post a copy of my (Armed Forces) ID card??
hahahaha
Would YOU post a copy of your drivers license????

"Jeffrey Herman" <jeffreyh@Hawaii.Edu> wrote
> Posting a copy of one of the following would clear up this matter:

Blake, have you ever gone thru the NPSAC/APG program or witnessed it to know
the facts?

> No, you are wrong, and clutching at straws to try to make it
> seem that you might correct. The United States Navy
> clearly says you are wrong, yet you don't believe it? Nah,
> you just want to argue. I have given verifiable PROOF about
> what I have posted. Undeniable proof.

Please post your verifiable proof you are referenceing with the web link
within 24 hours or be found to be a liar by default.

I STRONGLY suspect that you closest you have ever come to Navy duty
was the "Oceans of Fun" theme park in Kansas City!

> Just you John, a raw, very little trained, raw recruit.

A "raw recruit" would still be higher & more experienced that YOU, Blake!!!
But actually, I am clearly NOT a recruit of any kind. I have graduated from
Basic Training and am now an NCO (Non-Commissioned Officer). At this point
I
would supervise recruits & lower enlisted members!!

what
>
> Here you go, trying to get nasty. No reason for your starting, but

No, just posting the historical truth, something that shows you in a way
you don't like.

3. Re: Help: AT&T freqs, NJ?

Also, search the FCC database for AT&T Corp. The security in our building (in Atlanta) are rent-a-guards, but the frequencies are licensed to AT&T. FYI, the 451.325 frequency is for the AT&T Construction crews throughout the US.

They are almost impossible to find. Expect to pay significantly more than $200. I also have an R-5000 but I have not been able to find the VC-20. It might be easier to buy another R-5000 with one in it!
Brian Denley

Source record: 78567

Interesting how people go off on 'sidetrack topics'. Where the hell did I say anything about speeding at 80 mph and using the scanner for 'evasion' purposes. Tom KB2FIK , I thank you for your response to that very inexperienced person out there bashing truckers. It is 'one sided/narrow minded ' people as that one who don't see the 'whole picture'.
Glenn, I am using a Radio Shack magnet mount scanner antennae. I would like to think it's range covers 42 mhz. I would have to research that on RS web page.
Now, for you morons out there wondering why ANYONE would want to listen to a scanner (police/fire/highway patrol). It is a hobby of mine (I am sure you have hobbies, some of which include green leafy substances which are illegal). It is nice to use a CB to rely on road hazard coming your way, it is nicer to hear on the scanner you are about 15 miles away from an overturned tanker with no EMS on scene. I could go on with the 'safety' reasons to have a scanner. If that doesn't clear it up for you idiots, get your head outof your ass!!

Eric G.
ignorance is no excuse.....

I've seen devices that are mounted in technician's vehicles that do exactly that. The devices read out the site id, signal strength, and plenty of other information, in addition to providing a speaker for sound quality monitoring. These test sets are fully stand alone and do not interface with a scanner. In my experience, telecommunications test sets are some of the most grossly overpriced items in the world, so even if you could purchase one, the thing will probably cost at least ten grand, and possibly a lot more. I've seen some recent data monitoring gear go for 35-40 grand each.

The ability to change display colors has been available on some car
stereo systems for 15 years. But then again, Uniden still can't seem to
figure out how to make their handheld models accept alkaline batteries
OR rechargables. <G>

It is thier obligation according to the FCC to fix it. Identification
of the problem equipment is the problem of the power company.
(hire an expert and give him or her the equipment to do the job).
Once identified he can go to the next problem and the problem
equipment can be replaced by a line crew.
>

Just you John, a raw, very little trained, raw recruit.

> This reminds me of the time you tried to tell someone the power ranges of
> a Motorola radio & I corrected you (& the rest of the group) by telling what

Here you go, trying to get nasty. No reason for your starting, but
your obviously attempting to shift the thread away from the subject
where you have been found and proven to be incorrect.

You will most likely start your malicious cross-posting now. Why
can you not just have a reasonable discussion?

Try looking in www.lcblanton.com then at the bottom of the page, select trunking info. When you get there, pick the state of Louisiana and look through the list.

I will let you know ahead of time, that the new system that Jeff Parish went to is a digital trunking system. You won't hear much on the system. All you will hear is white noise.

Jim

dealers say "november" so sayeth the flock.

in the new RS catalogue there is a TIII for sale and some people swear they have seen it at a few stores....anyone got a few extra bucks for gas to find out....?

RS has those new rubber duck antennae for portables and still none in stock at most stores I contact here in Calif.

will try internet order....it usually works.

bill

1==> Doubt if it is that easy to "fix" actually. Glazed ceramic
insulators would be pretty good when newly installed, but get coated
with dust, various salts from various sources, pollution, develop
micro-cracks in glazing, etc. All these provide high voltage leakage
paths to earth from miles of wiring which makes an excellent radiator.

In Australia, primary transmission is usually 330 kilovolts [kV] or
330,000 volts. Secondary transmission lines are usually from 132 kV
to 66 kV, and high voltage distribution lines from 33 kV to 11 kV.

So it doesn't take much leakage somewhere to produce a fair bit of
broadband interference, but for most people this isn't a problem.

2==> The first main problem with "fixing" leaky insulators is to find
the faulty one, which isn't that easy unless there is enough leakage
to cause a visible discharge. If caused by accumulation of dust and
salts, possibly only a problem in high humidity conditions. Enough
wind driven rain can wash surface contamination off, temporarily

clearing the condition.

3==> The second & third problems is that even if did find it would usually involve closing down the line to replace it which would usually involve a fair number of service interruptions and greatly increased line maintenance costs.

4==> The fourth problem is that although only a tiny proportion of customers are bothered by interference, most are bothered by increases in costs of electrical power. Would the majority of users be willing to pay, say, twice as much for their electrical power just to reduce or eliminate interference that only bothers a small percentage of users? Very doubtful.

5==> Then too, insulators aren't the only problems. Line fuses, cable clamps, etc. can become corroded, causing minor sparking. Again, at voltages involved, enough to cause interference, and again difficult to find.

There are often problems on customer premises that radiate interference back on to the supply lines. TV, microwave ovens, welders, various sorts of industrial & medical equipment, etc.

6==> Basically, it all comes down to cost effectiveness. I suppose it would be possible to produce a PTFE ["Teflon"] coated insulator which would be far superior to a glazed insulator, as nothing sticks to PTFE. However, the cost of such insulators would be much higher than glazed insulators, and the cost of replacing all the glazed insulators on a system with PTFE coated ones would be very high.

Placing all power lines underground would probably help a lot as well, but this isn't a cheap solution either.

7==> A minor warning: Suggesting any sort of government regulation of private enterprise for any purpose on misc.survivalism will cause some members to foam at the mouth and reach for their keyboards to issue scathing and highly critical replies. ;-)

38. Kenwood R-5000/VC-20 VHF Converter?

Newsgroup: rec.radio.scanner
Date: 2000-10-01 00:00:00 UTC
From: Richard Valentine <rwv@home.com>
Message-ID: <S_LB5.7704$P82.1229927@news1.rdc1.ct.home.com>
Source record: 78586
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner,rec.radio.shortwave

Does anyone know how the Kenwood VC-20 VHF Adapter for the R-5000 compares to the VHF convertor for the Drake R-8? Or... If anyone has the Kenwood Converter, I'd be interested in hearing about it. I'd like to put one in the R-5000 if it's worth it.
I have one in the Drake that works excellent. The Aircraft band for example, is much more selective and sensitive than any of my "scanners" picking up towers the scanners wont. Wondering if The VC-20 has similar quality. Thanks for any info,
Rick.

Yes, it is. The only problem would be actually proving that the lady was
NOT suffering from dizziness or some other malady. If she's fine every time
she gets to the hospital, they would have some leverage against her, but any
lawyer would argue that she really was ill, and nobody would be able to say
otherwise.

Sad, but that's probably the way it'd fly.

Body handling: HTML body converted to readable text

I starting to have a problem with power line RFI in the spring of 1999.
I called the local power company, and told the girl that answered what
was happening. A day or so later a couple of flunkies arrived, and asked
me if I had a portable AM radio they could borrow. I politely told them
to go back, and find someone that knew what he was doing, and send him
out. They left. I called back, and politely asked to talk to the resident
RFI engineer. At the time, he was unavailable, but he did call me back.
He asked a few questions, and told me he'd be out to check things as soon
as possible.
Much to my surprise, he did come, about two days later. After asking more
questions, to make sure I had done my home work, he produced
the correct equipment to check things with, and disconnected my house to
make sure it wasn't coming from there. It wasn't.
In less than 30 minutes, he had 2 bucket crews, along with 2 smaller
truck crews on the scene. two, and one half days, (20 hrs) later, I had
the quietest location for radioing I have ever had. They practically
rebuilt 10 poles with new insulators. Tightened everything. From an S9
constant noise, to no noise. NONE. These boys knew their stuff. One guy
was constantly coming back to my house to check to see what kind of
progress they were making.
When I was fully satisfied, they continued to fix 2 more poles, just in
case. After they were through, the RFI guy came back to chew me out for
letting things get so bad. Told me, as an Amateur, it was my
responsibility to help the power company stay informed.
What I learned, is that if you are persistent, but not rude, check out
the situation so you know how to answer questions correctly, and make
sure you let the power company know that you are aware of the rules, most
times they will cooperate.
Whatever you do, don't just call, and tell the lady that answers what you
THINK, and rely on her. She probably hasn't a clue.

52. Pennsylvania Statewide Situation Report list

Newsgroup: rec.radio.scanner
Date: 2000-10-01 01:33:52 UTC
From: PA-Sit-Rep <PA_Sit_Rep@yahoo.com>
Message-ID: <8r64a0$om5$1@nnrp1.deja.com>
Source record: 78554
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

PA-Sit-Rep is the Pennsylvania Situation Report group e-mail list.

The purpose of PA-Sit-Rep is to keep all list subscribers up to date on activities and situations throughout Pennsylvania. Pennsylvania communications enthusiast are welcome to join the PA-Sit-Rep list.

The list is a free communications tool that will enable you to report and monitor situations throughout the State of Pennsylvania including weather emergencies, natural disasters, environmental disasters, police activities (major emergency events only), civil disturbances, political developments (ONLY OF THE MOST MAJOR IMPORT) and military activities such as urban (MOUT - Military Operations on Urban Terrain) military exercises.

List members are encouraged (but not required) to send reports to the list pertaining to any of the above activities. You don't have to be a PA resident to subscribe, but only reports pertaining to Pennsylvania Situations and are of MAJOR IMPORT are permitted.

While most subscribers receive the e-mail list alerts to their home computers, the PA-Sit-Rep e-mail list may be also be of particular interest to individuals who own wireless devices capable of receiving text messages. The list protocol is designed to accommodate the users of these devices, which are usually either text capable pagers or digital cell phones that are of limited message length capacity. PA-Sit-Rep subscribers who are users of these devices will have instant access to any critical information from the list - even when they're away from their computer. Most digital cell phones have text messaging capabilities (check with your cell phone service provider for details).

If you are interested in joining the list (it's free and you may un subscribe at any time), send an e-mail to pa_sit_rep@yahoo.com with "PA-Sit-Rep Subscribe" in the subject line and the e-mail address that you would like to have subscribed in the message body.

Thanks, and we'll look forward to your active participation.

Not true. Apparently some college kid (An indian, I believe) proved
that GSM was cryptographically weak. Of course, he's probably
been snuffed with cash (or a bullet) from the GSM consortium....

However, the problem still exists of implementing the decryption, and
because of the communists in the united states, no legal research into
doing this can go on here.

While we're on the topic..... is anyone aware of a system that ever
existed to monitor and track AMPS calls? From what I understand,
before the law was passed, some people were in the process of
developing a package that could be mated to a regular scanner, that
would decode the digital fart and allow it to follow a phone.

Must not be that hard to do, because if the phone knows where its
going next, it shouldnt be that hard to figure out... I recall

reading about a certain mot phone when it was engaged in test mode
would allow you to recieve other phone conversations; and it even told
you in hexadecimal, which channel the conversation was going to
move to next....

"for information purpouses only...."

-Mike

I was recently looking at the WinRadio Universal FSK decoder software:

http://www.winradio.com/home/fskdecoder.htm

Evidently, this works with any SB sound card. Unfortunately, it costs
about $400.

Does anyone know of any similar software at lower cost?

>KG8PM
>http://www.mindspring.com/~helmsman

1==> Doubt if it is that easy to "fix" actually. Glazed ceramic
insulators would be pretty good when newly installed, but get coated
with dust, various salts from various sources, pollution, develop
micro-cracks in glazing, etc. All these provide high voltage leakage
paths to earth from miles of wiring which makes an excellent radiator.

In Australia, primary transmission is usually 330 kilovolts [kV] or
330,000 volts. Secondary transmission lines are usually from 132 kV
to 66 kV, and high voltage distribution lines from 33 kV to 11 kV.

So it doesn't take much leakage somewhere to produce a fair bit of
broadband interference, but for most people this isn't a problem.

2==> The first main problem with "fixing" leaky insulators is to find
the faulty one, which isn't that easy unless there is enough leakage
to cause a visible discharge. If caused by accumulation of dust and
salts, possibly only a problem in high humidity conditions. Enough
wind driven rain can wash surface contamination off, temporarily
clearing the condition.

3==> The second & third problems is that even if did find it would
usually involve closing down the line to replace it which would
usually involve a fair number of service interruptions and greatly

increased line maintenance costs.

4==> The fourth problem is that although only a tiny proportion of customers are bothered by interference, most are bothered by increases in costs of electrical power. Would the majority of users be willing to pay, say, twice as much for their electrical power just to reduce or eliminate interference that only bothers a small percentage of users? Very doubtful.

5==> Then too, insulators aren't the only problems. Line fuses, cable clamps, etc. can become corroded, causing minor sparking. Again, at voltages involved, enough to cause interference, and again difficult to find.

There are often problems on customer premises that radiate interference back on to the supply lines. TV, microwave ovens, welders, various sorts of industrial & medical equipment, etc.

6==> Basically, it all comes down to cost effectiveness. I suppose it would be possible to produce a PTFE ["Teflon"] coated insulator which would be far superior to a glazed insulator, as nothing sticks to PTFE. However, the cost of such insulators would be much higher than glazed insulators, and the cost of replacing all the glazed insulators on a system with PTFE coated ones would be very high.

Placing all power lines underground would probably help a lot as well, but this isn't a cheap solution either.

7==> A minor warning: Suggesting any sort of government regulation of private enterprise for any purpose on misc.survivalism will cause some members to foam at the mouth and reach for their keyboards to issue scathing and highly critical replies. ;-)

One didn't need PC's for remote control of irrigation pumps, mate.
Are talking about simple tone control, and well within the technology
of the time, although not as easy to implement as it is today.

However, if you would like to challenge me on this issue, think that
could probably dig up some information on how tone control circuits
were available even before CB was available, or was here at least.

No need for even the technology of pocket calculators, let alone PC's.
:-)

AFIK, "tone keys" have been legal for a long time, at least on
commercial 2 way equipment, were legal on amateur equipment, and
possibly even on CB gear.

However, permission for "selectacall" operation doesn't mean that
could use code for messages.

The AT&T sites in NJ are guarded by Wackenhut (I know, I used to work for them). They use standard business band radios. Look up the freqs allocated for business uses and try scanning those ranges... You'll have to get a look at the antennas on the radios - if they're short, they're probably in the UHF range (400 - 500 mhz). If they are long, they are probably in the VHF area (150-170 mhz).

I think the cost is relatively speaking, cheap. Even a shack full of
expensive equipment, a couple of towers and a ton of antennas, can
be had for much less than the price of an SUV, or something
like that, and deliver a lot more enjoyment.

A lot of it though, all depends on how much you "like"
radio. I'm pretty much a devout enthusiast, so throwing
$2000 at a radio (or a bunch of things for the hobby) is not
something that would be entirely out of the question.... whereas other
people will foam at the mouth and scream "blashphemy" if I mention
that kind of investment.

For the most part, for me at least, its a lot of cheap thrills.... a lot of people had said the "death of monitoring" is coming because of public saftey agencies moving to digital systems, etc, but thats far from the truth. There's a hell of a lot more to pick up... in different parts of the spectrum.

One of the key things I've noticed since I got into this hobby, is it usually is better to KEEP something than to sell it, for you usually regret it later.... Having a "plethora" of equipment proves quite versatile, even though you might not be using it all at once. :)

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2042 and PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published on the CARMA email list, carma@qth.net. You can obtain a free electronic subscription to the CARMA email list. For more info, see:

http://www.qth.net

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Most meetings are be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL.

Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

You can query FCC databases directly from this web page: | http://www.fcc.gov/searchtools.html |

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Other frequency web sites include:
http://www.fordyce.org/scanning/ and
http://www.scannerway.8m.com.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring

Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is

there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask

for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the

ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

Uniden sells refurbished scanners dn you can check current inventory at their web site:
http://www.uniden.com/docs/store

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120
Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the ICOM IC-R2, Uniden/Bearcat BC3000XLT, and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 2000 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229, email: electra@tcon.net,

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor

controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal
fundamental frequency. Merely supply International with
the exact receiver model number, printed on the rear label,
and the frequency you want to monitor. They will perform
the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second
local oscillator crystal is 11.155 MHz regardless of band.
On VHF high band (148 - 175 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700
series, one for each local oscillator. The crystal
formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the
first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

HAMFEST/COMPUTERFEST CALENDAR 2000 - ILLINOIS
last updated August 15, 2000

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, John Wass KA9QJX, Tom Harker, and ARRL for providing some of the information.

OCTOBER 2000

Oct 1 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Oct 8 (Sun): Cedarville, IL - Stephenson County Repeater Association amateur radio and computer hamfest. Jane Addams Community Center 430 W. Washington St., Cedarville IL. 8:00am-2:00pm. Admission $4.00. No advance ticket sales. Indoor table cost $9.00 for one, $5.00 per each additional. Tailgaters $4.00 same as admission, limited space available. Talk in 147.390. VE testing, times to be determined. For table reservations: coordinator Ruben Dowman KB9OLF (815) 563-9020, email: drads115@aol.com or Mel Welch (815) 563-4377 or Russ Love (815) 563-4921.

Oct 14 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Oct 15 (Sun): Orland Park, IL - Giant Computer Show & Sale (see below). Orland Park Civic Center, 147th St. & Lagrange Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Oct 22 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

NOVEMBER 2000

Nov 5 (Sun): Davenport, IA - Davenport Radio Club. Iowa National Guard Hanger, Mt. Joy Airport. Talk-in 146.88 MHz repeater. http://www.gwltd.com/hamfest

Nov 11 (Sat): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Nov 12 (Sun): Orland Park, IL - Giant Computer Show & Sale (see below). Orland Park Civic Center, 147th St. & Lagrange Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Nov 18 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Nov 18, 19 (Sat, Sun): Ft. Wayne, IN Fort Wayne Hamfest & Computer Expo. Allen County Amateur Radio Technical Society. 2000 Indiana ARRL State Convention. Allen County War Memorial Coliseum Exposition Center. Hours 9 AM - 4 PM EST Sat, 9 AM - 3 PM EST Sun. Admission $5 plus $2 parking. http://www.acarts.com

Nov 26 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

DECEMBER 2000

Dec 3 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Dec 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Dec 17 (Sun): Orland Park, IL - Giant Computer Show & Sale (see below). Orland Park Civic Center, 147th St. & Lagrange Rd. 9:30 AM - 3 PM. Adults $6, children $2.

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer
expo. The event is held on designated Saturdays from 9:30
AM to 3:00 PM. This show features computers, supplies,
games, parts, software, accessories, CD-ROM, monitors,
diskettes, printers, keyboards, modems, disk drives, cables,
expansion boards, services, etc. Lake County Fairgrounds,
Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall
Building #1=9720,000 sq. feet. For a show map, exhibitor
info, and discount coupon, visit the web site at
http://www.ccxpo.com.

last changed June 11, 1998

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is
Uniden/Bearcat 760XLT	R58 22K replace with 6.8K
	or other value.
	(select value for
	the particular radio.)
	Located on pin 14
	of MC3359P IC
Uniden/Bearcat 800XLT	R91 860K replace with 2.2M.
	Located on pin 14
	of MC3359P IC
Plectron P1	R81 180K may be ok as is
Plectron 700	R96 180K replace with 560K

Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://home.cfl.rr.com/scan/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the

squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Jan 1996 - Plectron & Motorola Alert Monitors
Feb 1996 - Radio Shack PRO-2042
Mar 1996 - Tips for Fixing Bearcat Scanners
May 1996 - Compendium of Scanner IFs
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters

Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)
Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500
Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable
Sep 1999 - Uniden Bearcat BC245XLT portable
Oct 1999 - Plectron R700 series monitor receivers
Nov 1999 - Uniden Bearcat BC278CLT clock radio scanner
Dec 1999 - Uniden Bearcat BC248CLT clock radio scanner
Jan 2000 - Radio Shack PRO-92 portable scanner
Jan 2000 - Stridsberg Engineering FLT201A FM Notch Filter and
MCA-204 Receiver Multicoupler
Feb 2000 - Yaesu VR-500 portable wide coverage receiver
Mar 2000 - Uniden Sportcat SC-200 portable scanner
Apr 2000 - Understanding Intermod,
(comparison intermod performance of several models)
May 2000 - Radio Shack PRO-94 portable
Jun 2000 - Radio Shack PRO-2052 trunk tracking base scanner
Jul 2000 - Electra Tiger Scan TSA portable
Aug 2000 - Phone patches; Identifying scanner crystals
Sep 2000 - Radio Shack PRO-2067 trunk tracking mobile scanner
Oct 2000 - ICOM IC-R3 portable wide band scanner |

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of

banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical

relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8

character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback.

Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents

4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage

to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are

backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test

unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR

scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be

programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image

rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The

Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per

channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date.

Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search.

No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. For a service manual, call SONY at (800)488-7669, and press 3. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you

find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes

FR2526 10 X X yes yes
FR2527 10 X X yes yes
FR2528 10 X X yes yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and

wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

I really doubt that they are doing it as a "Scanner Prevention" method.
Unless the system can automatically do it on its own. Reason being
small towns (and a lot of large ones) do not have their own electronic
service people. They rely on contractors to do the reprogramming
and at about $50. an hour rates I doubt if a small town would spend this
kinda of dough just so scanner enthusiasts couldn't listen in.

Either their system does it automatically or they have a problem and
they do have a tech working on it. Your guess is as good as anybodys.

I used the one from Junk Shack for years. Only problem with the glass mount antenna are that they're not designed to be removed from the glass!
It can be done but you take a risk of breaking the glass. If you plan on selling the vehicle in the near future take that into consideration.

Unfortunately they're NOT so good in the VHF LOW band. I have a lot
of trouble monitoring CHP (39-43MHz) with this antenna. The 3 segment
mag mount from RS works great on this and all other bands I've tried.

81. RS Pro-89 vs. Uniden SC180 or other?

Newsgroup: rec.radio.scanner
Date: 2000-10-02 00:00:00 UTC
From: gcouch@my-deja.com
Message-ID: <8raoh3$5bc$1@nnrp1.deja.com>
Source record: 78463
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I have zero experience with handheld scanners (other than the two times I've rented them at my local CART race).

Wanting a scanner for a recent race, I ventured out to several stores and wound up with the RadioShack Pro-89. In my purely subjective opinion, I seemed to be getting a lot of interference that my friend with a rented scanner (Uniden I believe) didn't pick up.

I, therefore, went out a purchased the Uniden SC180. I was happy with it's performance. It however, costs a lot more than the Pro-89 (I got the 89 for $129, the SC180 was $179), has 100 fewer channels (probably not a big concern for me since there aren't 100 cars in a typical CART race!), isn't PC programmable (again that that big of a concern), but has an alpha display (handy for my wife who doesn't know the car #'s).

Either feature set is fine with me and I'd like to keep the Radio Shack and save the $50. However, again, my subjective opinion was the Uniden did a better job. Is this because the Radio Shack was working "too" good? I did have the bigger antenna installed on both (the Pro-89 comes with a shorter antenna). I didn't think at the time that the bigger antenna would possibly pick up more interference from the surrounding area. I just thought I'd hear the drivers better.

Does an experienced user out there have a head-to-head comparison they've done or experience with either? I want to keep the *better* scanner. The feature differences (as I've mentioned) aren't really that big a selling point. What if I'd used the smaller antenna on the Radio Shack?

One other point. I used two pair of earphones and a splitter this year. I anticipate getting a couple of headsets before the next race. Any difference between the two here?

I am still within the 30-day return for both scanners.

I would be open to any other suggestions from experienced users. However, I'd really like to stay below the $200 price point. My sole reason for the scanner purchase it to take it to sporting events. Is there a better option? Is either one of these plenty adequate? What if I venture to Road America (I really, really hope to someday!) where the natural road course ventures for 4+ miles?

I appreciate any help that you can provide.
Greg

> Questions: Is it normal for a town to re-program their trunk this often?

It can be normal for an EDACS system to cycle through control channels. Whether it does it at all, and if so, how often, is a system parameter set by the controlling software. It requires no human intervention. On an 8-channel EDACS system where I live, I have seen the control channel move between 5 of the channels. Motorola systems can also do this, but are limited to a maximum of 4 eligible control channels on a system no matter how many channels are in the system as a whole. Many systems are set up so the control channel never changes. I don't know what the rationale is for a moving control channel, but maybe someone else can tell you. As the control channel will only ever be amongst the pool of frequencies available to the system as a whole and therefore easy to find, it doesn't make much sense as an "anti-scanner" measure.

I personally like the performance of the uniden handhelds over MOST radio shack handhelds. I may get hammered on this if I am wrong but I believe the SC180 is a triple conversion and the pro 89 is a dual?? If you are set on saving money, the pro 89 "might" work better if you can find one of those short antennas like they sell at the NASCAR races. I've heard that using one of those helps cut down on all the interference too. But after all this, I "personally" still like the sound quality and the overall performance of the SC180.

No, it's not normal, but without knowing why they're doing it,
it's hard to speculate on anything.

Your best bet would be to get a data slicer hooked up, and run Trunker
or Treport on the system, and see what freqs that comes up with.

Bought a VC-20 at Leicester-absolutely excellent. Cleanest AM of any set that I have had, plus the benefits of those filters.
Sensitivity very good, selectivity excellent, antenna used is the Isopole.

Roy

89. Electronic Voyuerism and the ICOM R-3

Newsgroup: rec.radio.scanner
Date: 2000-10-02 00:00:00 UTC
From: Michael Harpe <mike@ple-technology.com>
Message-ID: <sti09eb910s12e@corp.supernews.com>
Source record: 78471

No one seems to be talking about this so I want to start something new...

I am really surprised that the ICOM R-3 was type accepted. To me, the ability to receive the video from all those new wireless video systems, including the ones that can be used with camcorders, is asking for trouble. If you want to talk about the potential for privacy violations, this is every bit as large an exposure as cellular phone scanning.

Just imagine what's going to happen the first time some couple has their "private moments" posted to the Internet as "MyNeighbors.MPG" for all the world to see. Even worse, suppose some clown connects his R-3 to a capture card and turns the bloody thing into a webcam??? Oh sure, you Law Enforcement types will yell and scream and maybe even arrest said clown but the damage will have been done. The people who intercepted Newt Gingrich only got a wrist slap and Linda Tripp got away clean with a direct, out front, absolute violation of Federal wiretapping laws. So don't talk to me about The Law.

It's going to get very weird very soon. Mark my words.

Mike Harpe, N4PLE

P.S. Yes, I am going to buy an R-3!

Reasons NOT to buy a AOR8200-II:

Pretty pricey...complex to program...shortwave bands are not very sensitive...no trunk tracking...costly accessories approach the price of another scanner.

First if any couple is having private moments and they are using a wireless video transmitter, well then they are dumb. Second any real secure video monitoring system isn't wireless, they use cables and multiplexers.

Source record: 78475

It is quite normal for the data channel to rotate between 2 or 3 frequencies, but it is not normal for it to show up on a totally new frequency time after time. However, it sounds like something that happened here last year. The old system went quite, and I found it on a frequency licensed to Nextel. The best I can figure is they traded frequencies or bought them from Nextel. It was difficult to find all the new frequencies without trunker.exe

I think your current problem is that you do not know all the frequencies in the new system so finding the data channel after it moves is a challenge. Running Trunker.exe would be your best bet, but you can also search the latest FCC recordes to see if they have the updated information. Other than that, you need to find someone in your area that runs trunker.

Another channel of video.
Neighbors at that.
Boring.....
Don't they put deranged people doing an act like that in jail.
You know..peeping toms.

Now, if they ever broadcast the video live from a police chase and you
could intercept that and watch it ...sort of a cops LIVE.
That might get my attention.

Well, that's kind of my point. With the evolution of webcams, where people VOLUNTARILY put webcams in their houses and charge money to let people connect and watch what they do, I don't know if what I talking about will be considered illegal or not. Maybe that's the thinking the FCC used.

I'm not advocating recording this stuff, I am just fascinated by the implications of this technology being available.

FCC gurus: Where is the documentation on a Part 15 type acceptance? Are there comments?

On an amateur radio note, this unit will be outstanding for seeing what's doing with fast scan ATV!

I moved mine from one vehicle to another. The only problem is, you need to
get another glass mount kit (or some REALLY good sticky foam tape) to mount
it to another vehicle. I got a kit from a cellular phone place which did
the trick.

I have one and it is easy to program if you sit down with the manual and take it slow. Adding alpha tags makes it more complex. I use ARC8200 software and makes loading 1000 memories a breeze.

As for performance, it is as good as a wideband radio in a handheld package gets. A hand held radio is a compromise and you must remember that. I've enjoyed mine all over the SE USA, I have different banks loaded with different localities...

You can do much worse in a handheld, but not much better, maybe an MVT9000 with Mika's computer interface?

No, it is based on copies on official US Navy documents, or copies
thereof, on an official US Navy web page. No hearsay. I have proven
beyond a shadow of a doubt that you are incorrect.

> > However, understanding that your level of training and experience

That has nothing to do with the fact that the NPSAC school is
not 20+ years old as you incorrectly stated.

First off, I have done those jobs, and reached higher positions
that you will never reach.

Secondly, in light of your question above, what employer did you
do those jobs for, and how long?

> > I just recently purchased an Optocom reciever, including Cellular
> > due to what I do for a living, and am very impressed with the

> communications?

Well, gosh John, for someone of your vast experience, one would
think that you would qualify this a bit. Some satelite reception
is done with basic analog recievers, capable of recieving from 144
up, which is well in the capablity of any current vhf scanning
reciever, and would not require any mods of the same.

Exactly what are you talking about?

That's a pretty broad description of what you'd like to do. I'm not aware of anything available (but I'd like to see any links if there is).

(For those who may not be familiar with it, the Basic Stamp is a very small computer with a simple programming control language. You can see it at http://www.parallaxinc.com/ . Hmm, I see they have some new stuff. I'll have to look around again.)

Presumably you're thinking of using the Basic Stamp to interface with a scanner that doesn't already have a computer interface. So, I guess it would have to connect to the keyboard in some way for input, and it would have to connect to the display for output.

I know there are circuits out there to do the keyboard part. They usually have electronic switches that emulate the keys, so the interface "types" data into the scanner, just as you would by hand. The nice thing here is that speed is not critical. (In fact, it's better if you go slower so the scanner's processor can keep up.)

Interfacing with a display would be harder. In theory, if you knew the matrix layout for the display, you could build a circuit that would monitor the scanning of the display and feed that into the Stamp. It sounds like a lot of work, though. It's not clear that the Stamp would be fast enough to keep up with the data anyway. (From time to time I think about pointing a digital camera at the display of the scanner, and writing software to decode what it sees. But then I snap out of it. :-)

Unless you're thinking of this for educational purposes, you're probably farther ahead just to buy a scanner with a PC interface.

> transmitters, therefore not their problem.

In the States, Part 15 of the FCC regulations does place restrictions on devices that, while not designed to transmit radio signals, do incidentially radiate. The regulations are sporadically enforced.

Two good examples: Computers, which must be qualified either for residential (less radiation) use or commercial use. The Commission has been known to prosecute the import & sale of unqualified computers. But an awful lot have gotten through & been sold. And, cable TV systems, which are required to keep their signals in the cable. Systems have been required to suspend operation when excessive leakage has interfered with other services - usually aircraft communications, but in at least one instance amateurs. Actually, these are much better about compliance (I suppose they don't want to risk the nightmare of being blamed for an airplane crash!) though they have defacto reallocated 145.25mHz out of the amateur service...

Anyway, incidential radiators *are* theoretically the FCC's problem. It's just that they don't assign them a very high priority.

I have one also, and have used it for several years. Works excellent on 800 MHZ, and even good on low VHF. The antenna consists of a black box connected to the cable and the antenna element. The black box mounts on the inside of the window and consists of (I'm assuming - never taken it apart) a pickup coil to pick up the signal from the antenna. Sometimes, the antenna works well just on the black box alone, without having the antenna on the window. Especially for 800 mHz.

If you're a ham, I'd suggest getting a 2m version, that way you could use it to transmit as well as receive. Alternatively, if you used a regular cell phone antenna, that would work great also. It would probably work better on 800 mHz than the RS antenna.

117. "floating" trunk data channel??

Newsgroup: rec.radio.scanner
Date: 2000-10-02 00:00:00 UTC
From: Richard R Olson <rolson@faatcrl.tc.faa.gov>
Message-ID: <8rah32cid1@faatcrl.tc.faa.gov>
Source record: 78546

I posted the following question last month, and received one reply (thanks to whoever responded!):

I've been scanning my local southern New Jersey, US PD/FIRE/MEDIC/GOV't with my 245XLT for a few months. It's a small (5 freqs) Ericson(EDACS) trunked system.

Last Saturday, POOF! gone! Nothing. The control channel is quiet (and so are the four other 'comm' frequencies). I can hear other local trunked systems okay, so I know the 245 is working.

I think they've only had this system for a year or two. Could they have gone digital?? Any way to detect this change?

////////////////////////////////////// New post starts here:
Well, they didn't go digital, they just moved to a COMPLETELY new set of freqs (still within 866-868Mhz). I spend a few hours finding the freqs, entered them in a new bank, and everything worked okay, for awhile.

Except now the data or control channel changes every few days! I mean that the old data freq goes quiet, but I can still manually SCAN the comm traffic on the other 4 freqs. I have to search for a new strong data channel in the range, reprogram in a bank and can scan the trunk again.

Questions: Is it normal for a town to re-program their trunk this often? Could this be some sort of 'scanning prevention' effort, or are they just trying to 'tune' their system (whatever that means!)?

Thanks,
Rick

If you have MS Excell you can make a really easy spreadsheet, or if you
don't have Excell then you can download Star Office from Sun Microsystems.
Star Office is kinda large and not nearly as good as Excell but it's free.
If you want to see an example of a spreadsheet I made just email me.

>

John, first off, your liar by default thing is a joke, and widely
known as such. Secondly, I have provided clear reference to you,
in a manner that a Navy Radioman, or IT person, should rapidly
be able to reference.

However, understanding that your level of training and experience
in Navy matter is sorely lacking, I will give you some web pages
for you to reference. Perhaps, with time and someone taking the
time to guide you, you too will be able to reference a message
by its header.

http://www.navres.navy.mil/navresfor/n7/apgmsg.txt

or

http://www.nera.org/scuttlebutt/

or

http://www.navres.navy.mil/navrsfor/nrn/past/feb00/page3.html

They clearly state this program REPLACES the APG school, and the
standards have changed due to that. That is NOT the same program
rather one they decided did not meet their needs, and they changed
to the NPSC program.

> I STRONGLY suspect that you closest you have ever come to Navy duty
> was the "Oceans of Fun" theme park in Kansas City!
>

Seeing as I was in another branch of the military, you are
close to being correct.

> No, just posting the historical truth, something that shows you in a way
> you don't like.

John, you have never even come close to approaching the level that I
am at in the Two Way field, and you will most likely never get that
high. My advice is to keep dreaming.

Now, to drag this on topic, <Notice I changed your malicous subject
to something much nicer, and in line with where I am going with the
message>

I just recently purchased an Optocom reciever, including Cellular
due to what I do for a living, and am very impressed with the
quality of the reciever, as well as the capabilities. We are using
it for remote logging of frequencies, for our nationwide customers
when licensing new sites, and a plethora of other items. <Our
customers foot the bill for us to fly to the remote tower site,
set up the equipment, and then for us to return to the site
later and analyze what is in the log, finding them the best
new frequency for them to license on> We gets lots of
helicopter time that way. What has your personal experience been
with this unit, and is there some other product that your
personal experience would recommend for the same type of use?

121. St. Ignace, Michigan?

I just returned from a nice three day weekend in Michigan's Upper Peninsula. We stayed in St. Ignace, MI., just over the Mackinac Bridge. I took my scanner up there for the first time, hoping to snag some action. I monitored 155.9100MHz, and 158.8500MHz. These frequencies were designated for service type "PP" per my Percon Spectrum CD-ROM. However, there appeared to be no activity! Is St. Ignace really that quiet at night, or have they possibly moved to the state's newer digital system?

Thanks,
Bill Crocker

Could it BE that you don't even know your own Rate??

Information Systems Technician (IT): Formerly known as Radioman (RM). Naval activities often involve people working at many different locations on land and at sea. ITs operate the radio communications systems that make such complex teamwork possible. ITs operate radio-telephones and radio-teletypes, prepare messages for international and domestic commercial telegraph, and send and receive messages via the Navy system, including satellites and antennas. ITs also are responsible for all computer systems, network administration (including LAN hardware), peripheral operations and systems modifications. Data Processing Technician (DP) rating merged into the RM field in 1997.

The converter works very well with selectivity and sensitivity as compared to my Pro-2006 scanner (using the same antenna) . But you must know the VC-20 is much more limited in spectrum capability. You might have a difficult time finding a VC-20 converter though.

>>or eliminate interference that only bothers a small percentage of
>>users? Very doubtful.

>Irrelevent, it is mandated by the FCC.

2==> Obviously the FCC doesn't agree with you. :-) ...And are you even sure that your FCC is required to do anything about it? From memory, have seen something about this problem somewhere several years ago. Don't remember if the article was reprinted from a US source and dealt with your FCC or local and dealt with our equivalent.

In any case, though, the government agency involved pointed out that their job was to minimize interference between users of communication devices, or perhaps more broadly, devices designed to emit RF energy.

Their argument was that power lines, fluorescent light fittings, neon advertising signs, the neighbors welder, etc. were _not_ designed as transmitters, therefore not their problem.

Vehicle ignition systems can cause a lot of interference, especially when owners replace carbon leads from coil to distributor and distributor to plugs with stranded wire high voltage leads thinking it will "improve performance". It won't, but I doubt that there is any law against doing it.

It is possible to almost completely shield vehicle ignition systems, but I don't think that the FCC could force vehicle manufacturers to do it.

3==> However, it would be very easy to find out, wouldn't it? Contact your nearest FCC office, tell them that you think your local power lines are causing you a problem and ask if the power company can be made to fix the problem. See what sort of an answer you get and let us know.

> Anyone who has suffered thru Bill's dumb posts understands that
>"complex" is a relative term...

I own an AR-8200 and I'll totally agree with Bill's reasons
not to buy one.

As for complex operation just look at a simple task as toggling a
bank in or out from scanning. On the AR-8200 you must press:

F
SCAN
Arrow-down
Bank number key
ENT

To add to complexity both F and Arrow-down are located on the
left side of the scanner while the other keys are on the keypad.

The same operation on a typical Uniden or Realistic scanner is
just one keypress: Bank number key.

Speech Inversion is accomplished by mixing the speech spectrum
(typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some
audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz
constituting the speech inversion.

I just got my 2001 catalog and my free laser bar code reader andf I saw
in the catalog that Radio Shack has two new F.R.S. radios:
one is a base station amd the other is a mobile. The mobile radio is
contained in a H2O proof plastic container right under the antenna, and
the remote that changes the channels,etc looks like a ham radio device
that stays in your car.

Hi,

I just started to develop commercial ARC3 software for the new ICOM R3
scanner. This software will be the same type of software like the package we
developed for the ICOM IC-R2.
You can read about the ARC2 product for R2, or download a
demo of ARC2, at our website http://www.butel.nl
ARC2 reviews will be available in the near future at strongsignals.net and
in MT.

I just got the R3 for communications tests and we are now able to 'talk' to
the R3.

I would like to get feedback from Icom R3 users about things they would like
to see implemented in the new ARC3 software.
I did not get the CS-R3 software yet so if there are people using that
software and have remarks about it, please let me know. I heared printing is
not possible and clipboard cut/copy/paste is very limited.
ARC3 will have our famous 'Webcatcher' that can read frequencies directly
into the software from any website. And it will support import of free
Percon files.

Again the options for ARC3 will be at least the same as the ARC2 software.
List of all the options at our website in the R2 software section..

Tnx and regards,

Gommert Buysen - gbuysen@butel.nl

If YOU went to public school, it was a waste of tax money, because you
sure don't
know how to read/comprehend anything about the 'new' Michigan Public
Safety Communications
System, nor compare/contrast it with the 50+ year old VHF lowband system
still currently in use in
your area by MSP, DNR, et. al. until the MPSCS Phase 4 is complete.

If Uniden or Realistic had a scanner with the capabilities of an
AR-8200, I'd buy it, as you probably would. But they don't, so we
bought the 8200. I think that's the bottom line.

156. Tough decision on the purchase of a scanner

Newsgroup: rec.radio.scanner
Date: 2000-10-03 00:00:00 UTC
From: bob1355740@aol.com
Message-ID: <20001003172013.09660.00000161@ng-ch1.aol.com>
Source record: 78418

I'll keep this short and sweet. I'm looking to buy a new scanner.
I've narrowed it down to three.
A: ICOM IC-R10
B: Alinco DJ-X10T
or
C: ICOM IC-R3

I can't seem to decide on the matchup between the R10 and the Alinco.
But I've thrown the R3 into the mix because I am VERY interested in the
reception of the Broadcast and ATV signals. the only drawback is the HUGE gap
in the 800's band. Who owens an R3? Have you been happy with it? Have you
been able to pick some some interesting ATV signals? Taken it to sporting
events? i.e. in-car cams, ABC's Ref. Cam, other wireless sports cams?

Out of the 3, what would you pick?
Thanks,
Bob

No, it is based on YOUR limited interpretation with NO assistance
or guidance from knowledgable people.

You have provided nothing but hearsay.

Blake - do you admit that you have NEVER been thru the NAVY NPSAC/APG
program or directly witnessed it and are basing your statments only on your
personal research & understanding of what others have said or wrote?

> Goes back to the old saw, "just enough training to be dangerous"

The above saying sums up YOUR knowledge of Naval issue very well.

> > > "NPSAC WILL BE ONE OF FOUR PHASES OF TRAINING DESIGNED TO
> > > MEET TITLE 10 STATUTORY AND SECNAV POLICY REQUIREMENTS."
>
> That has nothing to do with the fact that the NPSAC school is
> not 20+ years old as you incorrectly stated.

Your above statement clearly indicates that you are not aware of what NPSAC
was more that a year ago. So OBVIOUSLY you are incorrect!

> Nothing but honesty, thats me!

You must be trying something new!

> > What branch of the military were you in & for how long? What rank were
you?
>
> Chuckle.

That's pretty bad when even YOU laugh at your own military duties!

> First off, I have done those jobs, and reached higher positions
> that you will never reach.

What, you got a summer job re-roffing a two-way shop & think
that was a "higher position" because you had to climb a ladder??
hahahahahahahahaha

Cool...Now Digital Convergence can know everything you scan. I'm sure
you haven't scanned anything like your CD collection, contents of your
pantry, movies, magazines, ect. The colonCat transmits it's serial
number and what you have scanned back home. There, they assemble a
database of your family, and sell this to anyone that wants to
telemarcket, junk mail, or spam their way into your house.

Enjoy!

.ps I have 5 colonCats. One on my rearview mirror, one that my 10
month old chews on, one as a cat toy, one I'm saving for later, and one
that I dissambled just to see what's inside it. What the hell, they
are free at Radio Shack. They don't even ask for your real name and
address.

The explanation I heard for this is pretty convincing: The transmitter on
the control channel frequency is constantly transmitting, duty cycle of
100%. Rotating the control channel spreads the load so that you can go
longer between transmitter failures. And of course if one of them does
fail the system can just not use that channel until it's fixed.

175. Stereo and 700Mhz's scanners??/

Newsgroup: rec.radio.scanner
Date: 2000-10-03 00:27:17 UTC
From: bob1355740@aol.com
Message-ID: <20001002202717.18664.00000074@ng-cg1.aol.com>
Source record: 78489

Hey Guys,
I'm trying to do some wireless mic decoding. I know that the
frequencies are between 700 and 760mhz using the FM band. So I need to find a
possible scanner that can recieve those frequencies. As I am going to be
using the headphone jack to do some recording, I was wondering if anyone knows
any scanner that can put out a STEREO output. That way I can go straight from
the output to a DAT, or Tape Recorder. I know that this probably doesn't
exist.......but I thought I'd take a stab.
Anyone have any light to shed on
this??
Thanks,
Bob

The right to privacy is one thing, but come on, if you're shagging live on air then you deserve all you get.
Anyway, if you're that way inclined, what's wrong with a bit of voyeurism if it's put on a plate?
I know I would laugh my b*ll*cks off if I caught my neighbours on video.

Well, the manual for the SC180 reads:

"Programmable Alpha Characters - You can program up to 100 channels
with alphabetical characters for easy reference".

Since the SC180 only has 100 channels, I assume that means you can
label every frequency you store. It allows 10 alphacharaters (upper
case, lower case, and a number of other characters) per channel. They
are input via a knob you twist on top to cycle through the character
list. This is a little bit of a pain, but it only took me probably 15
mins to label the 24 or so frequencies I was using the weekend I was
using one.

I suppose the SC200, which like the Pro-89 is computer programmable,
would be easier to use when it came to labeling. But maybe that one's
software is hard to find also. Don't know about that.

Thanks for the feedback.

I don't know what triple conversion and dual conversion is. Would you
mind explaining?

The 89 actually came with a short antenna. Since I knew less the
weekend of the race than I do now, I thought that the longer antenna
would obviously be better since it would provide better reception. As
I understand know, that might not be the case, since the shorter
antenna would be sufficient to pick up the drivers and the pits and not
pick up signals out of the general vicinity of the race, thus less
interference.

Unfortunately, it is a while until my next race so I won't have the
opportunity to re-test the 89 in a race environment with the short
antenna for a while.

Hello Bill, as far as I know they are still on VHF. I am near Marquette and they are still in the process of installing the "Big Brother" tower at the regional post here. Parts are still on the ground. I heard it will be about 480 feet high but the national weather service here is just a quarter mile away. The radar is right in line with the new tower sight.
What a waste of tax money, very few advantages to the new system.

If computer controll is not major point (its very slow in AR-8200, in Mk2 model it work 19200 speed but its still painfull to use with AOR software)
In that same time what i use ar8200mk2 with computer, i program hole bank to my MVT-9000mk2 M3.5 by hand without any bigger problems, only alpha tag programming in Yupi takes more time.

Also, HF you think use HF band ever, choose other one!
HF band in AR8200/8200mk2 /ar8600 is useless!!! (poor! you can imagine how big dissappointment AR8600 was when i go to HF band and notice, its poor as 8200!) i'm thinking to sell that AR8600 and keep Yaesu VR-5000.

> As for complex operation just look at a simple task as toggling a
> bank in or out from scanning. On the AR-8200 you must press:
> F
> SCAN
> Arrow-down
> Bank number key
> ENT
>
> To add to complexity both F and Arrow-down are located on the
> left side of the scanner while the other keys are on the keypad.

Even Yupi is more simple to select bank in scan, it works in yupi like this:
bank number (1-20) and scan or
bank number (can be select four one by pushing exsample 1, 5, 8, 9) and scan, it scan banks 1 5 8 9.
or select those freely,
push . (dot) then scan, unit show you selected banks, if not like then, push ent, then turn knob/arrow keys and select bank with mon button or deselect with c/ac. and when your satisfied with bank selection, push

ent and scan.... (this scannin give you any combination of those 20
banks)

Its not hard to quess why i like Yupi.... ;)

(but i own all lates AOR handheld scanners too, 8000/8200/8200mk2 and
"couple" others ;)
In god i trust, others i monitor. =) =)

Regards
Mika

I have NEVER seen any part 15 warning on amateur equipment (new or used), nor
should there be one since such devices are manufactured for power levels in
excess of what part 15 permits (because they're subject to another part - part
97).

If you're not joking, then someone has played a joke on you. For that matter,
I'll sell you a can of squelch after the normal amount your radio needs has all
leaked out. ;-)

I've noticed that my 245 has a constant audio hiss once the radio is turned on. It's not extremely loud, but can be heard from up to 1 foot away in a quiet room. Is this normal? My Pro-91 also has an audio hiss from the speaker but is not as loud as on the 245. Thanks for any info.

There was a guy in my area that actually added a VCO modulator to make
FM, and coupled the L.O. output of his scanner to an antenna, and made a
low power transmitter out of it. He was fine until he started messing
around on the local police repeater, and then the FCC popped him.

> And I have seen super regens that leaged mW to the antenna. Would wipe out
> reception for 1/4 mile or more.

Ah yes, super regen walkie talkies. I always knew when one of them was
sneaking around my house. The noise level would jump up proportionally
as they got closer.

Actually, from all the info I've gotten so far there's a few guarded by
Burns Security now, like the Dayton facilities.

213. Y all those antennas ?

Newsgroup: rec.radio.scanner
Date: 2000-10-04 00:00:00 UTC
From: thuynh6969@aol.com
Message-ID: <20001004191328.09999.00000306@ng-fp1.aol.com>
Source record: 78372

In San Diego the cop cars have like 5 or 6 antennas on them.
One on the trunk and 4 to 5 antennas on the top of the car. The ones on top have gain on them and or either 5/8 wave or 1/2 wave cut with the coil in the middle and the spring type mount at the bottom. The one on the trunk has no gain, is cut 1/4 wave, and mounted through a hole in the trunk.

Does anyone have any idea what all these antennas are for,
besides the obvious (radio,mdt) ?

thanks !

How observant of you Tim, you are 100% correct! I have never owned an AR8200, for the reasons I've just stated. You apparently had trouble understanding that.

Oh yes, and the suffering from any of my post can not compare to the agony of yours! Tim, you are truly a legend in your own mind! Maybe you should go back to mi.misc where people like to argue with the likes of you!

Do they include trunked radio systems, including talkgroup
information? How about CTCSS or DCS info? Granted, I already know
all that for where I live, but for when I travel, I'd like to know.

223. Orange County, CA Harbor Police system?

Newsgroup: rec.radio.scanner

From: Glenn <1@2.3>
Message-ID: <sto28ji91s5h1f@corp.supernews.com>
Source record: 78382

Anyone know where I could find out what system the Orange County, CA harbor police use? Is it a trunking system? Are all harbors in Orange County on the same system?

I am new to scanning but would like to learn how to listen to the harbor patrol in Huntington Beach, Newport Beach, and Dana Point.

Would also be interested in San Diego County harbor too ;-) Oceanside, Mission Bay and San Diego.

I have a Pro-91 scanner.

Thanks, Glenn

No, it is based on YOUR limited interpretation with NO assistance
or guidance from knowledgable people.

You have provided nothing but hearsay.

Blake - do you admit that you have NEVER been thru the NAVY NPSAC/APG
program or directly witnessed it and are basing your statments only on
your
personal research & understanding of what others have said or wrote?

> Goes back to the old saw, "just enough training to be dangerous"

The above saying sums up YOUR knowledge of Naval issue very well.

> > > "NPSAC WILL BE ONE OF FOUR PHASES OF TRAINING DESIGNED TO
> > > MEET TITLE 10 STATUTORY AND SECNAV POLICY REQUIREMENTS."
>
> That has nothing to do with the fact that the NPSAC school is
> not 20+ years old as you incorrectly stated.

Your above statement clearly indicates that you are not aware of what
NPSAC
was more that a year ago. So OBVIOUSLY you are incorrect!

> Nothing but honesty, thats me!

You must be trying something new!

> > What branch of the military were you in & for how long? What rank
were
you?
>
> Chuckle.

That's pretty bad when even YOU laugh at your own military duties!

> First off, I have done those jobs, and reached higher positions
> that you will never reach.

What, you got a summer job re-roffing a two-way shop & think
that was a "higher position" because you had to climb a ladder??
hahahahahahahahaha

>
>Julian
>
You might wish to brush up on part 15.
All recievers that use a local oscillator must be part 15.
The LO RF energy is what is restricted.
Often it will be outside of the ham band.
IE, assume a 10.7Mc IF and a receive frequecncy of 146.000
The LO will either be 10.7Mc above (156.70) or 10.7 below (135.300)
Leakage on a low side LO could really cause problems with civil aero
operations.
I do not have the rules with me, put the leakage is spec-ed so as to not carry
very far. As a side issue, you can use a scanner [either scanning HT or
Radio Shack like the Pro34] as a RF generator. You have to figure out if it
is hidg side or low side LO etc, but they can make a dandy calibration source
for those on a budget.
And I have seen super regens that leaged mW to the antenna. Would wipe out
reception for 1/4 mileor more.

Normally what you say would be true, however as device that is
intended to transmit (it IS a Transceiver), it is exempted from most
of part 15. (It is pretty hard to build a transmitter that complies
with the conducted and radiated emissions requirements of part 15).

An excerpt:

"Section 302(d) of the Communications Act, 47 U.S.C. Section 302(d),
prohibits the FCC from authorizing scanning equipment that is capable of
receiving transmissions in the frequencies allocated to domestic cellular
services, that is capable of readily being altered by the user to intercept
cellular communications..."

You notice they don't mention cordless phones in this section, just
cellular. That's because there isn't any Cordless Telephone Industry
Association to lobby congress. It seems to me that the FCC doesn't give a
rat's behind about cordless, but don't think of tuning in cellular.

last time I checked they were on lowband around 45mhz...I think it was the old OC fire freqs(pre '81) but everyone is switching to 800 trunkes and astro so those days are numbered. however they will still be in VHF marine 156.800,157.100 so they can do the coastguard stuff.

O.C harbor pd
45.14 (control 54)
45.40 direct
45.92 tactical

>
> Would also be interested in San Diego County harbor too ;-) Oceanside,

Mission bay is on the city 800 system in the lifeguard talkgroup 4572

San Diego bay is under the port dist. and on it's own 5 channel 800 system. O'side is on 155.015

These antennas may be a for a system where a small transmitter is placed with money or in a bag with money and the PD is able to track using a LED style directional indicator under the dash.
The other could be a LOJAC system is auto theft is common in SD

You could probably get a limited-channel programmable pretty cheap off
eBay. One thing to watch for, though, is one that needs a new battery
- the replacement could easily cost more than the scanner.

The link would wrap so I put it here for you:

I have a Gre Super concerter 11 especially designed for handheld scanners that only go up to 512 mhz.You put this device between the antenna and the scanner, you then get 810mhz to 912mhz. down in between the 410mhz. and 512mhz. to hear cell.phones.This device comes with a 9 volt battery and you can purchase a ac adapter to use also.So if you want cell.and your scannetr only goes up to 512mhz. Then this is the device for you.It,s brand new in the box except for me to test it.$100.00 shipped to your door.Email me if interested at wilfkelly@home.com Thanks

This may be a dumb question, but this section of the statute prohibits
the FCC from approving radios with certain capabilities. Does the law
also prohibit listening to cellular phones?

> also prohibit listening to cellular phones?

Yes, US Federal Law prohibits listening to Cellular, Cordless, and some
other types of transmissions. It's just not part of that section of the
communications act, which is what's being quoted there.

From the FCC info: there are other statutes -- Federal and State -- that also govern the interception of radio communications and may make an activity unlawful and may subject the violator to severe criminal penalties. See, e.g., 18 U.S.C. Sections 2510-2520

Those sections prohibit cellular and cordless monitoring.

Are you saying that RS is seling the UNIDEN 780XLT trunk Tracker III?

Why would they sell a rival brand?

I bought one for my Icom R2, and it fortunately sacrificed it's life as I sat down in a car with the rig and
antenna in my pocket. (I use a telescopic whip).
It saved the SMA connector from getting ruined.
I've been using my second one now for about 6 months, and it works fine. I even have a third one as a spare in
case
I do something stupid again.

The ones with 3 or 4 antennas on the roof are tracking cars for LoJack
and Pronet.

LoJack is a tracking system for stolen cars, ProNet is a tracking system
for banks and businesses (money bags).

I live close to an army base here in Augusta, Ga. and here they use to use the 165ish frequency range. They changed not too long ago to the 405-420 range although I dont think its a trunked system. Try that range and see if you get any hits.

WRONG! Given the licensure & certification I have in the mental health
field of this state, there is certainly no way that I could or would be
intoxicated.
Also, since the binary you are referring to also shows other military people
present and at attention, they certainly would not have allowed the swearing
in to occur if either party were intoxicated.

> Fact: John took a 2 weeks of training put on by the Navy

Correct (however, you should take a course in basic grammar)

> Reality: The Navy is desperate for anyone,

WRONG, they are desperate for qualified capable people such as myself.

It's probably for the new Lo-Jack system, I've seen quite a few lately. It receives the signal emitted from a transmitter on a stolen vehicle and can be tracked by the police.

277. FS: SMA-TO-BNC PROTECTIVE ADAPTER

Newsgroup: rec.radio.scanner
Date: 2000-10-05 01:24:04 UTC
From: gulyas@netzero.net
Message-ID: <8rgl7f$11c$1@nnrp1.deja.com>
Source record: 78388
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.swap,rec.radio.scanner

If you have a need for an SMA-TO-BNC antenna adapter that is custom made to fit and protect your H.T. or scanner radio, I have the solution.

Adapter allows you to:
Quickly change antennas to base,mobile or different style use.
Use the more popular and wider selection available of BNC antennas.
Prevent chassis connector wear or from coming loose due to antenna changes.

Adapter features:
Gold contacts with a teflon insulator.
A low profile design with a rubber covering for a factory antenna look.
The rubber base seals to the top of the radio with no spacers needed for moisture and dirt protection.
The base provides an excellent support for any length of antenna or application.
No need to remove adapter once installed to make a quick and safe antenna change.

Sizes to fit radio models:
Yaesu: VX-5, VX-1, VX-10, FT-50-R
Icom: IC-T8A, IC-T81A, IC-Q7A, IC-R2
Kenwood: TH-D7, TH-G71
Alinco: DJ-V5
Standard: C508A, C510A
Radio Shack: HTX-200, HTX-400, HTX-245
Aor: AR-16

Previewed in the May 2000 Issue of CQ Magazine.

$11.95 + $1.50 S+H(One to unlimited)
(Check or money order only in U.S.Funds)
(Specify radio model)

>
Well, you might want to reread part 15.
Receivers and the CPU/Logic section in receivers or transceivers must meet leakage requirements. Type acceptance is dependent on the rx/logic meeting part 15.
And I was wrong when I said superhets.
Any receiver that generates any RF, eihter superhet, regen, super-regen or autodyne must meet part 15. And I think it applies to the IF leakages as well.
I have 2 Icoms. IC-25 and an IC-2AT, ND A UNIDEN mcb-25 [COMMON 3.5Wt 27mc CB] that have part 15 notices on them.
I don't have my regs with me, but CB Tx's, other than the 100mW toys, are not part 15 devices.
I think my Kenwood HF transceiver back home also has a part 15 sticker.
And the sticker is for the Rx and logic not the Tx. Any spurs etc are governed by type acceptance.
Have a good day.

snip
The VCO is part of most FM radios.
The AFC will accept audio and the receiver will "transmit" on the LO.
Some of the older tube radios make very nice "repeaters". Where we used to
live I could not receive a certain distant FM radio station. But I could
receive it on a ancient tube radio connected to a decent outside antenna.
So I coupled the Rcv audio into the AFC "port".
In the "stock" mode, with no etra antenna off the LO, the transmit range was
only about 50'. But with a 1/4 ground plane the range was extended to about
1000'. And since the radio was "locked" to a commercial station. the "Tx"
stayed right on frequency. I later rigged it to accept an audio signal form
any other source in the "Comm center" [Ham Shack]
I used this up until several years ago when the tube radio died and I found a
"baby monitor" at a good will store for a few bucks. Coupled to a decent high
antenna I could re-broadcast any RF to a scanner and recieve it out to several
1000 feet.
There could be many situations where it would be usefull to re-broadcast
some audio to your common garden variety FM BCB rcvr.
While this clearly violates part 15, and as a ham I should not encourage
anyone to break any radio rules, I have come to the opinion that if the people
charged with enforcment of the rules will not live by them, then screw it,
they applie to none.

First, thanks for the compliment.

Sure, post it. You can easily cover up your Service Number. There's
really nothing else to be concerned about, unless you don't want us
to see your picture. =:o (Oh, what's the color of your card?)

Date: 2000-10-05 04:41:06 UTC
From: Robbin Olson <rolson@mcg.net>
Message-ID: <39dc06cc$1@news.mcg.net>
Source record: 78395

Could someone direct me as to where I might find information regarding typical coverage for frequencies and the standard step sizes? I recently purchased an AR-3000A that permits setting step sizes, etc. My problem is that I have become familiar with RS scanners with preset mode (AM/FM, etc.) and step sizes and suddenly I do not have that feature.

Thank you for your help.

R. Olson

Yes, it's the quadrant required for tracking vehicles equipped with the Lo-Jack system which is activated when vehicle is stolen.
Most law enforcement air units - A.B.L.E. and A.S.T.R.E.A. in San Diego County are also equipped with the system.

Actually, if you verify the info and do not quote directly... you're fine.
So we're looking for people to monitor conditions, and then we cann the
agencies and ask about the incidents in question.

It's the way all News Operations work too...

lol Bill,
Anyway..i have an R3 and a AR 8000,but no AR 8200 to compare..but here it goes...
I have been told by Jim at ScanCat that the 8200 is much better on selectivity than the 8000.My R3 is better than the 8000 on SW,sensativity on the R3 for standard broadcast TV is better than my RCA TV with roof mount antenna.R3 is NOT good at the 2.4Ghz range,but i am looking for antenna's cut for this range.

Hope this help's alittle.

Cross-posted to: rec.radio.scanner,rec.radio.swap,alt.radio.scanner

I was just reading a review over on the strong signals site and just got to noticing that allot of radios were loaned to him by Bandercom for review. I also notice that "Strong Signals Press" "WebDES" made the Bandercom site!
http://www.strongsignals.net/press/sspwebdes.htm
Here we have a guy doing Bandercom's webpages and then they loan him scanners to do reviews on. (for free links and advertisement no less).
http://www.bander.com/export/exscan.htm
Now I don't mean to knock the SS website because it really kicks ass, but I do not value his BIASED reviews anymore. I would rather see some JOE SMOE review because he is being bought out by corporate America.
His reviews are great but he does it for more than just the hobby or fun......its business. When you mix in business, greed makes the decisions. He tends to give better reviews to the loaner radios than the ones he buys.

And about the "Accolades" page. Damn I bet his arm is double jointed because he pats himself on the back. Arrogance is the word for the day! It isn't enough that the newsgroup folks constantly chant "strongsignals, strongsignals, stongsignals" he has to post a fricking page with a crapload of "your the best" "great work" and so on. I'll admit, yes its a great site but I believe Rich is a bit stuck on himself and thinks his shit doesn't stink.
http://www.strongsignals.net/htm/accolade.htm

Have you ever noticed how much the site promotes certain scanner companies and others you never hear about. That's because the ones who loan or give him radios get promotions, free links, and special treatment even if they do not have the best price on that particular scanner or better service. You scratch my back and I'll scratch yours! Yes it's the American way but I sure as hell don't value his reviews as much when he got the scanner as a loaner. Think about it. You get a scanner on loan that cost $500 and it isn't as good as you hoped but since you have no money in it, you say oh well. Glad I didn't pay $500 bucks to find this out. On the other hand, if you did pay $500 and it wasn't up to what you expected then you bet your ass you will do a review that points out the bad side a bit more. You can't talk to bad about a free scanner!

Oh yeah..... Make sure to tell them SS sent you because you will get free shipping or a extra batterypack.

Now run on over and check out the new Yaesu VR-5000 Communications Receiver just delivered to him from Bandercom!
http://www.strongsignals.net/htm/latest.htm
I can't wait to see this wonderful non-biased review when he gets it done.

I know I will catch hell for posting this but I don't give a damn. I love being able to speak my mind.

Hey man, you ain't the first person to question his objectivity. The last time he got all indignant and huffed and puffed about it a lot. The fact it, it's gotten a lot worse... He is a major suck up now. But the truth is, he's no different than Monitoring Times and Popular Communications, which are nothing but shills for advertisers anyway. Welcome to reality.

309. Re: Tone Squlech/Subaudible Tones Question

Newsgroup: rec.radio.scanner
Date: 2000-10-06 00:00:00 UTC
From: F Barry Mulligan <70035.140@CompuServe.COM>
Message-ID: <8rlm9s$9lk$1@sshuraac-i-1.production.compuserve.com>
Source record: 78272
Cross-posted to: rec.radio.scanner,alt.radio.scanner

pdstore@my-deja.com asked:
> ... what are subaudible tones, why would I need to use this feature ...

CTCSS (Continuous Tone Coded Squelch System) is a sub-audible tone transmitted by many land mobile service users. Receivers on the system will not unsquelch unless they hear the appropriate tone along with the communication. The tone is filtered out of the audio before it reaches the speaker.
It prevents the receivers from squawking unless a legitimate signal is received. When several systems share a frequency each uses a different tone. The individual users only hear tranmissions from their own group, giving the impression of an exclusive channel. Motorola's trade name for it is PL - Private Line. A related technology uses a continuous digital code to accomplish the effect.
For the scanner user, if you do not use the CTCSS feature you will hear all transmissions on the frequency (along with the occasional noise burst, intermod, crosstalk, etc). If you enable tone squelch, you will only hear tranmissions that include the tone you selected.

I just got one last week and it too has a hiss. It's at a very low
volume. The sound is definitely *not* white-noise due to the squelch
being improperly set.

Let me know what you find out should you contact Uniden.

Thanks,

Skeeter

323. AOR 8200 MKII vs Icom R-3

Newsgroup: rec.radio.scanner
Date: 2000-10-06 00:22:49 UTC
From: nolba@nohoflink.com
Message-ID: <8FC4CC8C1lbahoflinkcom@209.155.56.96>
Source record: 78342

Hello, all...

I'm thinking of buying a new AOR 8200 MkII, but the soon to be released (in the US) Icom R-3, which has video output, will end up costing about the same.

Is the R-3's video just a gimmick? Or will the (does the) R-3 have reception comparable to the 8200?

What I'm trying to reconcile is waiting for the R-3 vs. buying the AOR now.

Thanks for any input.

Radio Shack doesn't make the radios they sell. The PRO-90 (also packaged as the BC235XLT) they sold was made by Uniden, the PRO-92 by GRE. No different than Sears selling Makita and Dewalt brand equipment (which they do). They are not competing with other brands... just selling 'em.

If Radio Shack is going to sell the BC780XLT, it would likely have a Radio Shack logo and PRO-XXXX number slapped on it.

Usually, the police will have different antenna for different bands.
Plus, they will have an antenna mounted on their car that picks up the
audio transmitter that they wear for videotaping purposes.

you can use the shoutcast plugin for winamp and record it in mp3 format -
saves on space big time as mp3 is 10 times compressed compared to wav format

winamp is free at www.winamp.com as is the shoutcast plugin for it - if you
cant find shoutcast on winamps site then plug shoutcast into your favorite
search engine

"He's quite a problem right now,' says police spokesman By Robert Wang

APBNEWS.COM

BERKELEY, Calif., Jan 5, 2000 ï¿½ Several police departments in the Bay Area are searching for a radio-frequency pirate who has invaded the police radio bands, transmitting bogus crime reports and profanity-laced

tirades. Another man was arrested in the Los Angeles area last week for a similar offense.

SPOKESMAN TONY PARRINO said the California Highway Patrol's communications center in Vallejo received eight to 10 transmissions in December on its frequencies from a man posing as a police officer and claiming there was a shooting in progress or a shot officer.

"He's quite disruptive, and he has caused our officers and other agency officers to roll Code 3 with red lights and sirens to different locations ï¿½ which have turned out not to be true ï¿½ at great risk to the public and to our officers and all public safety officers en route to that location," Parrino said. "He's quite a problem right now."

I do not know of any others that 'do it all' but you can find most FSK
modes covered by free or inexpensive software. Which modes were you
interested in?
PSK has dozens of free packages.
RTTY / AMTOR works very well with TrueTTY (DXSOFT.COM)
SSTV / FAX ... search the web, a number of good freebies for sound card
are out there.
Others modes are available too but you'll need to search for them.
The other way to go is to buy an all mode TNC (PK-232 etc.), they
usually come with the software, cover most modes and are available used
for a decent price!
....
Please... if you do find an inexpensive all mode sound card decoder
please POST it here.... I, and others, would be interested.

I think Rich DOES spend several thousand dollars a year for radios.
<G> Many others spend just as much on hobbies they also love.

I know radio control pilots, equestrians, full-scale private pilots, amateur race car drivers, boaters, hams, musicians, etc... Some of them spend big time money, well into 5 figures a year on a hobby. Some folks just can't understand that there are people that actually have that kind of love for a hobby and that they also have the where-with-all to participate to that extent.

I'm looking for a mag mount which would allow you to attach a rubber duck with a bnc connector on it....

I know I have seen these in the past. I want to try it with RS new "improved" rubber duck scanner antenna...have been impressed with it connected to my handheld and want to try on top of my van with mobile scanner.

Tired of having to get out and remove whip from other antenna before entering garage.

I stopped by the display at Dayton where they had a MacRadio logo on their backdrop. I asked to see it and they handed me WinRadio info sheets and told me to keep looking at their web site. The Mac version was not ready yet but they hoped to have some information posted soon.

You are an ignorant moron. Case in point: The first guy to post any review of the AR8600 and VR-5000 was a techniian from Bandercom! He slammed the AR8600 for many things. He also pointed out weaknesses in the VR-5000. He also posted his thoughts on the SS site. Why would Rich feel any pressure at all to give a good review to a radio that the supplier itself has already slammed? Why do you feel everyone's objective opinion is for sale? Rich has reviewed many radios and does it objectively. As soon as Rich gives a good review to a poor scanner for kick-backs, he will lose credibility. Those that are informed, do not question his credibility.

If Rich is so full of himself, why does he make so much space avalable on his site for all to comment and participate in the discussion groups? His bias would be exposed right on his own site in those groups. Go take a look. Many intelligent people frequent those discussion groups, and they do not contradict Rich's reviews and opinions.

Criticism such as yours has been posted before and Rich responded by identifying every radio that was on loan and every radio that he paid full price for. That radios on loan are very few.

His loyalty to dealers is based on the colletive community of scanner buyers, not just his own experiences. The dealers he lists and recomends have a proven track record backed up by many different people. Sure they may be other companies that are just as good, but not listed, but only because they don't show up on the radar of a large enough group of scanner enthusiests. Most of the dealers that are recommended, are truly interested in furthing the hobby, not just turning a quick buck. There are plenty of low price leaders that may not be listed, because they are just low-ball electronics dealers, not true scanner enthusiests.

Do your homework before you go on the attack.

Another scannist is bitten by the digital bug.
Is anybody becoming aware yet,of what a serious threat digital is to our hobby?

Regards
Mark

All scanners recive digital signals. The question is getting
something to decode them. I hear that there is softrware for
computers, if you can get the signal in.

I have heard the same said about Consumer Reports. The
products/companies
who pay the most, get the best reviews.

Is this true about Consumer Reports, too? Maybe a better question would
be, "What mags and reviews is this NOT the case."

Bruce

You thought wrong, Chuck. (What's an "illegal pre-amp mic" and how does it differ from a legal one? Are you referring to operators who transmit with greater than 100% modulation?)

No, the only thing I try to help eliminate is your illegal operations on the HF trans-oceanic air-to-ground frequencies where you're endangering the lives of those onboard aircraft, and your 10m bootlegging. What you do on 11m makes no difference to me.

>From what we hear,

There's that elusive "we" again! Why do you insist on always inserting "we"?

... And just where's the link to YOUR unbiased website?

You might take another look at the accolades page. It isn't Rich patting himself on the back but rather others, like myself, who appreciate his HARD EFFORTS. Rich's website is listed first on my links page for a good reason. No one out there has a better all around scanner website, period.

Be more than a NG troll (flame bait post, cross posted), create your own website, then let US judge your work.

The complete replacement service is only $15.00 or you can
get the complete instruction pamphlet (14 pages full of high
resolution images) that walks you through the replacement
process. Only basic tools and basic soldering skills needed.

... Or you can put a lamp in front of your scanner so you see
the display. ;-)

If it is just the rubber keypad membrane, you can still buy a
replacement from Radio Shack for about $10.

P/N 10788107 "KEY,TOP" To order parts call
1-800-843-7422 or visit your local Radio Shack store.

You'll get a much better price by taking a high res picture and
selling it on Ebay.

Good luck,

Robert

It was very nice to see a picture of the PRO-46. Mine has been dropped about 40 times (without a case), and
the numbers are totally worn off the rubber keys. Once it even fell into a bucket of water while it was on.
But this rig keeps working well, although it doesn't look as pristine as the one in your picture does.
Al

Did you ever think that the "deal" was that they would loan him radios for review, which he returns after review, in exchange for him doing the website? Which would mean that essentially, Rich gets the free use of a radio for review purposes only. Would you expect Rich to spend several thousand dollars each year to buy radios for review? Rich also gets radios and equipment for review from Scanners Unlimited, the Ham Station, Pozilla Software and other sources.

It is easy to "speak your mind" (what little there is) under the guise
of anonymity.

Your silliness below is not worth wasting time with. Any serious
radio hobbyist knows that Rich Wells is a major asset to this hobby, a
gentleman, and an extremely smart individual. I only wish I had the
technical skils he posses with regard to radios and computers.

Yes, I too am jealous of Rich, with affection.

No one can expect Rich to do the amount of reviews he does without
getting "loaner" radios from somewhere. Period.

If you feel his reveiws are biased as a result, that is your opinion.
I do not see you, or anyone else offering reviews on the internet to
the extent that he does.

If you are an intelligent, free thinking individual, you take what you
want from his site, and do as you see fit.

I am grateful the site is there, and again, thanks for Rich for a
great job.

392. Question Regarding Ambu. Traffic.

Newsgroup: rec.radio.scanner
Date: 2000-10-08 00:00:00 UTC
From: Craig Hauke <haukec@softhome.net>
Message-ID: <_WYD5.2720$Df7.235734@cletus.bright.net>

Hello,
I have a question- Our Local Life Squad recently purchased a new ambulance. Every Since they have been running in that new squad- we have NOT been able to hear any of their transmissions to the hospital. The transmissions between the squad and communications come in perfect--but there IS NOT any traffic what-so-ever on hospital band. Really, in the county, there is only one or two squads that are still able to be picked up on those frequencs for Brown County ER (155280 155340 155265). I have noticed that on this squad (and other ones in the county that I can't pick up calling in) on top of the unit they have a THIN approx. 3-5 inch antenna. (Smaller than a normal AM/FM Radio Antenna) Does anyone know what that antenna is for, and possibly some other frequencies that they could be using, or if they are using the cellular phone? The County is Brown County Ohio.

Thanks!
Craig R. Hauke

it is a matter of known fact that if you post from
most news servers, your IP of origin is included
in the posting (in the header called nntp-posting-host:).

It is very difficult to forge this header, but not impossible.
A little investigation though can be very revealing.

That IP is, in fact, a USWest Domain IP (uswest owns it
and allocates it to its users)

With a few tools, it can be determined if there is a machine
on that IP currently, and with a little more digging, exactly WHO
is on that machine.

so, you see, unless you happen to be a master programmer, have
extensive knowledge of networks and their topology as well
as basic and advanced concepts of tcp/ip, I don't think you can
conceal your real location for very long (especially from a determined
individual with such knowledge as described previously).

one other (and important) note:
I did a tracerouting on that IP.

its a DSl circuit located in seattle Washington
Based on the responses I obtained using nmap, I can deduce that
its either an intel based internal router (ethernet card) or
a cisco external router (probably a 675).

in either case, there are specific exploits and security holes
that can be used to gain access to the system located on the
other side of such a device (better read the security notices
at www.bugtraq.com).

Given the trace info, I am fairly certain you are located
within the seattle city limits and with a few more minutes, I can
determine where the first main server outside of your system is
(which would put me less than 15 kfeet from you).

Now, do you really want to pester folks in here?

Thank You!
That is what I am looking for.
I have wondered for the last decade if it was all a joke,
but kept thinking that someone went to a whole lot of trouble
for a hoax.
And it is online, so I do not have even track down the orignal
Popular Communication.
Again thanks, every now and then my faith in my fellow man droops,
but then I run into someone who takes the time to help and it
really brightens my day.
Good scanning!
Oh, and I am into SWL/scanning/hamradio and Low Earth Orbit Wx sats.

400. New Feature

Hi all,
We have added a new feature to the site www.frequencyuk.co.cuk
How to decode .... with a scanner.
The first is a step by step guide to receiving weather satellite images.
This is to help people expand their hobby now that we are close to the
digital age. There will be more of these guides to follow in the near future
Also lots of new frequencies added and updated.

Problem is that you cannot post any on your site, nor advocate any
decoding software.

New laws are being considered that if you even link to a site with
"decoding" software on it from your site, you can get in trouble.
Goto ZDNet.com site and look up the DVD lawsuits currently pending
and occurring. Also, look at Napster.

This, of course, like so much of the hi-tech world these days, it a
HUGE argument. If a radio signal is passing through your house, your
body, and your brain, do you have the right to "receive" it and
decode it? If someone is broadcasting "in the clear", do you have
a right to receive it? If you cable company is pumping a signal to
you that you asked them to turn off and they are not currently billing
you for it, do you have a right to turn your channel to see the
"scrambled"
version of the program?

I suspect this is going to apply to digital scanners, eventually.
Probably
already does apply to digital decoders. If not, give it a few months.

I am not intending to start a huge thread (though I probably just have),
but you get my point. I saw a DVD site the other day from an internet
search engine that had been shut down for this very reason. However,
the site told me to search for a particular string and I would find all
the decoding software I could ever download.

It is definitely and interesting topic to watch unfold in the courts.

I was just at Juns's in Culver City and they had one. www.juns.com. It's
kinda big and clunky compared to other receivers that are out on the market
now.

I'm into SWL/SSB utility listening and also like to nose arround
higher up the spectrum on occasions :)

Has anyone any views on this receiver ? Is it worth the price tag?
How does it compare with say a dedicated HF set (IC-R75 / NRD 535 etc)
and a run of the mill scanner for VHF/UHF?

From the description you gave of the antenna Craig, it sounds like your squad might be using UHF med channels to communicate with the hospital. Those freqs. are : 462.95, 462.975, 463.000, 463,025, 463.050, 463.075, 463.100, 463.125, 463.150, 463.175. Try those on for size. If that isn't it, I suppose they might be using cell comms.

The new base-station FRS unit - says on the packaging and in the promotionals that it operates on all 14 FRS channels. -
BUT-- though you can access any of the 14 FRS channels - you must remove a cover on the bottom of the unit, and set a DIP switch to change channels - functionally this is a single channel radio, that lets you choose which of the 14 channels you want to operate -- to me, it seems that it shoud say - operates on any one FRS channel, rather than say operates on all 14 FRS channels.
-- you also must set a DIP switch under the unit to set of change CTCSS codes.

There will be eventually. There are standards wars to be fought yet so it might be a little while. As long as the news media is so dependent on scanners to get breaking news stories, there will be scanners. The news media will be our salvation here. They have the bucks and the clout to keep them legal.

Remember, no one thought there would be Trunk Trackers either...

Source record: 78244

That would be the Opto Cub (not club) but the Scout is much better, with a ability to store up to 400 different frequencies in memory and also count up to 255 hits per freq in memory. The scout can also tune a scanner to the frequency being captured, where as the cub does not. Also the cub will only get one frequency at a time and will not attempt to capture another frequency untill you press a button. Opto also sells a number of other counters that can capture tones (PL, DTMF, Mot, LTR etc..) and they sell a few that can demodulate the audio too (thus eliminating the need for a scanner, well sort of). I almost bought a cub because it has a real nice price of $100, but I decided that I needed the memory and reaction tune of the Scout. Hope this helps.

> > personal gain?

In the US, it depends on what you are monitoring. If it's government communications, you have a constitutional right to "discuss/divulge" what the government is doing. If it is "private" communication, meaning that conducted by a business or an individual other than those excluded under law, the legal situation is different.

436. OT But Interesting

Newsgroup: rec.radio.scanner
Date: 2000-10-08 02:46:09 UTC
From: Dante'@inferno.net
Message-ID: <8ron5hnua1@news.uky.edu>
Source record: 78147

Sorry for this OT post but I am desperate.
I thought about posting this qestion in a crypto group,
but, they are not all that likely to have seen the data I need.
Several years ago Popular Communications had an article on a
weird medieval manuscript that had "text" in a language and script
that was unknown. And the plqnts, while similar to real European
plants, where also unknown. It was not an April Fools joke, and a
friend just mentioned that he studiied it in Linguistics over 40
years ago.
I lost my copy when we moved from Central Kentucky last summer.
We are both interested and are trying to track this down.
I tried to contact the fine people at Popular Communication but could
nto get anyone there to understand what I wanted. After all, it is not
an article about anything directly or even remotely about radio.
But a lot of you guys (and gals) have mentioned PC, so I thought it
worth the effort. If this fails I will have to find a public library
and see if I can find it by a manual search.
The date of the issue would realy help, and I think the manuscript
has a name.
And to any and all who fume at this OT post, I am sorry and it
will not happen (from me at elast) again. So lets not add to the
ground clutter with flames.

Marine Police are division of NJSP and operate on their 800 MHz trunked system. Try subfleet B2-10, if you are so equipped.

Unsure of NJ Transit.

Consumers Union purchases all reviewed products on the retail market.
It does not accept samples from manufacturers, receives no corporate grants
or financial support, and Consumer Reports magazine has no advertising.
Consumers Digest (an inverse rip-off of CR) does carry advertising and
accepts manufacturers support.

If you have factual information about Consumers Union please post it.
Excuses offered by the vendors of failed products don't count.

Yeah they sell the Optocom with a board called "comcounter" which is a freq counter made just for the optocom, although I've never heard of anyone using it. Kinda silly to have a freq counter on a base station if you ask me, then again you can use the optocom without a computer but it sounds like more hasle then it's worth.

No CV-I for the pro 43, sorry. (BTW the Pro43 is a rockin scanner performance wise) And as far as the Scout 40 goes, youi will need to be less than 8 inches from your 46 Mhz phone for it to lock on. These phones are just too low power for a Freq Finder to lock onto. I think it's the same story for the 900 phone too as long as it isn't spread spectum... if it is then you are out of luck again.

If you are interested in listening to cordless phones you are probably are better off doing a scan between two freqs.

The cars with 4 antenna's are the pronet cars...those units track the "echo" and also have handheld recievers.

The units with 3 antennas are lojac.

Or is it the other way around...
A.B.L.E. has both...A.S.T.E.R.I.A. only has lowjac. There is also a lojac base station at the International Border...but it's usually unmanned. A few months ago a guy tried to flush a pronet transmitter taken during a robbery. The cops tracked it to the pipes in front of his house...he went to jail and the cops called a plumber.

Phones have been protected by law from tapping pretty much since they
were invented. This created a legal expectation of privacy, right or
wrong, on wireless phones. Does such an expectation of privacy exist on
wireless video devices?

and what do you base this opinion on?

take a good look at your TOS and tell me that again...

BTW, intentionally directing spammers to spam
an e-mail account that isn't a source of spam is considered to be
illegal activities on the part of most ISP's.

in particular the ISP I use has a provision in their contract which gives
them the right
to not only terminate the services under specified clauses for such
activities, but also
can charge for the hassles (such as increased use of bandwidth, operating
outside
of the specified terms and conditions of the contract, etc.). Its called
breach of contract
and in civil court, can cost you a bundle in legal fees and judgments.

Cox@home has already done this to several troublesome users in the Arizona
state region. So, telling me to shut up doesn't help... the information is
freely
available in court records here....

yet your IP or origin came from there (A traceroute discovered this)
and the hostname of the machine indicated it was a DSL circuit (I should
know, I deal with tech support questions on DSL circuits everyday of the
week)

better read up on the RFC's dealing with networking (and TCP/IP in
particular).
I might also recommend you go over to www.linux.org and check out the
documentation on TCP/IP and HOWTO's (these often point to other
sources of information that go into deep detail on the subject).

I think the 99.5% of the public, when the buy something that is
"wireless", has absolutely no idea that they are actually using a radio
and that they can be listened in to.

I have 3 banks programmed in my pro-92,
all of the freqs I got from reliable sources,
however, most of the time I cannot use this
scanner for more than 5 minutes at a pop
without it stopping at one or more freqs and getting
hung up on this annoying loud buzz! I tried locking
them out but soon all the freqs would in turn be buzzing
and what's the sense of having a scanner when you
are constantly locking/unlocking freqs and not able
to follow any action?
A few months back, people were talking about some
inherent problems in this scanner, is this one of them?
Or am I just not programming in something properly?
Or is this a problem inherent to my area, I live in southeastern PA.

Please Help,

Preesi

I have been scanning Redding Police even b4 they got a Motorola trunk system. They have had it now about 7-8 years. Their systtem has no constant pattern as to when it changes data channel. They have 7 freq on their system and use 3 of them for data (one at a time of course). On my scanners, I leave the whole 7 freq locked out and when I trunktrack, it still receives (unlike conventional scanning, locked out freq cannot be heard while in scan mode).

Frequency/Speech Inversion is accomplished by mixing the speech spectrum (typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz constituting the speech inversion.

Motorola Statement Regarding State of Florida Contract With Com-Net Ericsson Critical Radio Systems
2000-09-28 14:01:32
TALLAHASSEE, Fla., Sept. 28 /PRNewswire/ -- The following was issued today by Motorola:

Following a long and disputed procurement process for the completion of a statewide law enforcement radio system, the State of Florida Department of Management Services (DMS) today contracted with Com-Net Ericsson Critical Radio Systems, Inc.

Today's contract means that Phases I and II of the statewide system -- successfully installed and recently upgraded by Motorola -- will be completely dismantled and rebuilt. The Florida DMS contract award to Com-Net also covers the completion of Phases III, IV, and V. In response to the Florida DMS contract award to Com-Net Ericsson, Motorola's position is as follows:

We are disappointed that the State of Florida has chosen to sign a contract with Com-Net, the terms and services of which indicate the contract is not in the best interests of Florida, its residents and its visitors. The timing of today's contract signing is equally surprising and inappropriate, since there are currently several legal actions pending that seriously challenge the legal process followed by DMS in the procurement process, including alleged violations of the Florida Sunshine Law.

The statewide law enforcement radio system provides a critical communication link for public safety officers in state organizations such as the Florida Highway Patrol, Florida Department of Law Enforcement (FDLE), Fish and Wildlife Conservation Commission and others. Once completed, the system is designed to allow officers to communicate instantly and seamlessly across the entire state. As well, the system provides a direct communication link between state law enforcement and city and county law enforcement agencies. The system's design, reliability and ease of use are critical in officer arrest situations and directly affect the safety and well being of the public.

Although the State had a well-defined evaluation process in place to safeguard those functions, the appointed evaluation committee made serious deviations from that specified process. These inappropriate actions resulted in a contract that does not meet many RFP specifications and eliminates many user functions that are critical to the safety of Florida's law enforcement community.

Contrary to the contract procurement process that stated all proposals must be in "compliance with the specifications and requirements provided in the RFP," Florida DMS awarded the contract to a company that: ? Did not and could not "provide a system demonstration on an existing law enforcement land mobile radio system of like kind to that which is being proposed" (RFP Section 5.3.22.2). ? Provides for a lower number of radio channels than currently exists in Phases I and II, as opposed to the RFP requirement (Section 5.3.27) that the current number of channels or communications paths be maintained. The lower number of channels will result in less system capacity, which could be especially critical in the Miami area, which is already experiencing a need for additional channels. ? Has no contract provisions for "Overall System Uptime" -- the time during which the system is fully operational -- although the specifications in the RFP call for a system uptime of 99.5 percent (Section 5.3.24.1) and the Motorola system in Phases I and II has had an uptime or reliability exceeding that. Requirements for subsystem uptimes and system controller uptime (Sections 5.3.24.2 and 5.3.24.4, respectively) were also reduced or eliminated completely. This could lead to a significant reduction in system performance. ? Presented a system design that must utilize FCC frequencies not yet approved or secured, in violation of the requirement that "any frequencies used by the design must be currently licensable within existing FCC rules without rule waivers" (Section 5.3.2.6.2). ? Cannot replace hand-held control heads for use with mobile radios currently used by more than 700 FDLE officers to avoid detection in undercover assignments. Section 2 of the RFP requires "no loss of features" and Section 5.3.10.3 requires that the Contractor shall provide such control heads. ? Offers greatly lowered construction and performance bonds, which are supposed to protect the State in case of contractor default. The bonds were reduced from "the amount of the contract" (Section 4.23) -- more than $350 million -- to $36 million for construction, and approximately $14 to $15 million for performance. The contract also holds the state liable for the contractor's outstanding secured debt should the state take control of the project under default. Because the scope of work includes proprietary technology provided only by Com-Net, this bond issue represents extraordinary financial risk to the state.

In addition to the many deviations from state requirements, the contract also: ? Includes just 134 tower sites, 41 fewer than the State of Florida's system design calls for to achieve required 98 percent radio coverage. The proposed Motorola design offered the State 198 sites. ? Calls for a 36-month construction schedule, as opposed to the 18-month schedule proposed by Motorola. ? Includes mobile and portable radios costing twice as much as the current radios used in Phases I and II, and does not provide replacement radios for all agencies or the state universities on the system. In addition, the Motorola radios used by the state of Florida today are manufactured in Florida by Florida workers. That will change.

On several occasions, Motorola told the state that Florida did not get the best value for the public-safety community. In a last- minute, arbitrary decision, the state elected to eliminate Motorola's proposal for sharing revenue on the statewide radio communications towers, even though the state specifically instructed Motorola to provide such a proposal. Had even a

third of the proposed revenue been considered, Motorola would have been the low bidder as well as providing a more robust system that met all of the State's technical requirements.

Equally important, the State's action today demonstrates it has chosen to abandon its promise to state, county and city public safety agencies to build a system that meets the Project 25 North American standard. Phases I and II were designed and constructed to meet that standard. This universal standard was chosen and championed by Florida to provide communications compatibility between hundreds of governmental law organizations. And based on that position, dozens of city, county and state law enforcement agencies have installed like systems at their own cost. The public need for this communication compatibility has been demonstrated and proven in natural disasters such as Hurricane Georges and the East Coast wildfires. Under the terms of the contract announced today, Phases I and II equipment will be replaced with a different system technology that no longer provides communications compatibility with those agencies' existing systems.

Motorola's proposal would have offered the lowest price while still providing the state with more communications towers for enhanced coverage, a system meeting the requirements of the RFP -- which was written by the system users -- and completion within 18 months, as opposed to the 36-month timeline in the Com-Net contract. And, the state of Florida would not have to "throw away" a highly sophisticated $60 million communications system and get only a $2 million in salvage value -- or three cents on the dollar.

Motorola plans to continue its legal action against the State of Florida Department of Management Services. Motorola contends that there were serious flaws in the procurement process -- including several deviations from stringent technical requirements mandated under the original Request for Proposal -- as well as serious violations of the Florida Sunshine Law.

Motorola has a nearly 30-year history in Florida and employs some 6,800 workers in southern Florida, manufacturing public-safety radios in Plantation. The company completed installation of the first two phases of the $60 million statewide radio communications system in 1998. The system has received praise from its users and has demonstrated its cross-user operational abilities with different law enforcement agencies throughout their joint emergency efforts during the East coast wildfires and Hurricane Georges.

No, that was never an issue. It sounds like you're programming a trunked system, as conventional. Read the manual regarding how to program a trunked system, and make sure your scanning in trunking mode.

> Has anyone any views on this receiver ? Is it worth the price tag?

I do. I like it. BUT it isn't perfect.

> How does it compare with say a dedicated HF set (IC-R75 / NRD 535 etc)

It isn't bad, but it isn't as good as the two you site. The biggest two problems in it are that its filters are waay too wide and that its dynamic range is poor. But it is rock stable and has very good tuning and excellent ergonomics, especially compared with AOR offerings. It makes a great program listener, too, far better IMHO than the storied HF-150. No sync, but with the ECSS and the accuracy and stability of its frequency standard make it a pleasure to listen to, even for listening to music -- and I am *not* tone deaf!

(I bought an HF-150 at the current special price for program listening and was thoroughly disappointed in it. Anyone want to buy a mint/like new HF-150?)

I've thought about upgrading to a "better HF receiver" but haven't because the amount of improvement seems pretty insignificant to me until you start going into superset range (R-390, Harris, Rockwell-Collins, WJ, RX-340, etc...).

> and a run of the mill scanner for VHF/UHF?

Far far better than a run of the mill scanner on all things but one, which is that it has the ICOM habit of scanning one channel bank or all. All ICOM scanners do that.

But it has features other scanners wouldn't dream of: You can resize the channel banks -- use all the memories as a "pool" and set your first bank to have 5, your second to have 300, your third to have 11, etc.

It is all-mode. With an add-on box you can do TV reception demodulation (probably PAL for you, NTSC on this side of the pond). It is amazingly sensitive. We use one at a radio-telescope site because lab-grade receivers of the same quality were outrageously higher.

Is it worth it? IMHO, yes. I own two and have one at the
R/T site. I have to say that my first reaction upon seeing
one in a catalog was to laugh and wonder who would be
stoopid enough to buy one. Then I played with one and got
hooked.

I beg your pardon? We are talking about the same set with the big
tuning knob in the middle?

It is missing an a/b VFO, but you can direct tune the rig by spinning
the knob, and for HF or any SSB listening, set your step size down to
10 Hz. In fact, that's one of the few ways you can get any noise from
the receiver itself -- by crossing a preselector filter boundary
quickly.

> A Serious receiver this IS. A scanner it IS NOT...

I beg your pardon? 40 ch per second (in the real world, too!).
Complete with search-and-save functions that work?

> I read an article in this a while ago and the R-8500 was described as an HF

> If you wish to scan around and listen to all the many thousands of
> transmissions around then go and by an A.O.R desktop scanner or one of the
> many other desktop models for much less in price.

I beg to differ. Twice.

To my knowledge, only the AR-5000 is comperable in terms of tuning
flexibility (VFO). Most scanners have the multi-bank-but-not-all
feature but ALL ICOMs don't. It's an ICOM quirk, but with the
memory pool feature described earlier, you can do a lot with the
different sized banks. To say it doesn't have a VFO is to say the
Lowe HF-150 doesn't have a VFO because it doesn't have the a/b
feature or you lose your place when looking at memory. I can't
see how you can say it isn't a scanner at all.

I invite calm, non-inflammatory rebuttal.... but am wearing
my asbestos underwear, nonetheless. :-)

I have owned an R-8500 since not long after they came out. I agree completely with the description that it is more of a "receiver" as opposed to a "scanner" as people throw these terms around. It has been described to me as an "R9000-Lite". It supposedly has essentially the same RF guts as that monster, just not all the CRT muck.

The HF performance is quite good even on a marginal antenna. I use a discone and just move it between the two jacks. I hear all the broadcasters and even hams on 20 meters with no problem given good band conditions. The VHF/UHF performance is quite good. I can hear HTs at a train yard six miles away with no problems.

The scanning setup is a little strange and not really as clean as something like a PRO-2006 or some of the newer Uniden models. The computer control is pretty much useless unless you buy third-party software. I have been very disappointed with the quality of most scanner control software. I have looked at demos for most of the major packages and not been motivated to buy any of them.

The audio quality is superb IMHO. I have never heard better audio.

I do like the unit and would not part with it for anything.

I will agree with that, sort of, a little, to some degree... :-)

I don't think the two terms are mutually exclusive. Is it a good
receiver. Yup. Is it a good scanner? Yup. Is it the best receiver
out there? Sorry, no. Is it the best scanner out there? Sorry, no.
Does it do an excellent job filling both roles? IMNSHO, *YES!*.

I saw on a web page (somewhere?) the new Yaesu receiver
that will be available very soon. It seemed interesting.

You may want to check this option before making a final
decision.

Well,

Since he does not defend himself here, it is obvious that "Whistle Blower" was a major TROLL in this thread, and we all took the bait.

All is not lost, as it provided a great forum to shoot cudos to Rich Wells, who does not get enough credit for what he does.

Thanks, BLOWer....

Has anyone used the full version of VisualRadio with an R-10? Does it increase the scanning speed of the R-10? I have to admit that I like what I see in the demo version. It's the first software I've seen to be able to squelch detect with an R-10. I'm a little leary to shell out $100 for software without trying the full version. Are there any other control software packages for the R-10 that are as nice as VisualRadio but don't cost as much?

Thx
Keith

Don't go counting on THAT. The media already has digital scanners. They
are given radios by the departments using them, though of course with
'limited' numbers of channels activated.

Digital scanners? Yes, there will be some, probably, in time, for the APCO
standard. Which won't do you any good for listening to the police, who
will, unless going interagency, almost certainly encrypt, as well as using
digital modulation.

>and a run of the mill scanner for VHF/UHF?

Well Richard, I own an R-8500 and I have mixed views....
1.. Is it worth the price? I think you would have to really want a receiver/scanner of quality quite bad to go out and pay that much. Over here, New Zealand, they cost over $4,000 (approx $1600 - 1800 U.S) and only a few real dedicated listeners will ever get to know what they perform like. Ever since I first saw them, I wanted one but could never really justify spending that much when I already have a good HF receiver and a handful of scanners, both handheld and base/mobile... BUT a good and relatively unused one came up for sale on the second hand market just as I was going to update to a new PC.... The new PC took a dive.. I spent the approx $1000 US on the R-8500 and haven't really looked back. PC's come and go but a good receiver stays around for many, many years.....

2.. How does it perform on HF?
Well as I said I already have a good HF receiver, well, actually it's a transceiver,,, a Kenwood TS-570 and I am in love with this from the receiver point of view... It has, without doubt, the best receive I have ever listened to. I say that at the risk of inviting and argument,,, because it is so quiet and every little signal makes it through. Even the weakest signal is always audible unless the band is just plain noisey on the day. I have had many good receivers in the past too including Kenwood R-5000, JRC NRD 525 and many transeivers made by Yaesu, Kenwood amd Icom... I have also listened to many other transceivers and receivers and I would put my TS-570 up against any of them for overall pleasure of listening... So where does the R-8500 come in??? I would say that it brings in just as much as the Kenwood only it is a bit fussier on the antenna. It drags in a bit more noise too,, not much but definitely a bit more and in this respect, it loses its edge compared to the Kenwood. On a few ocassions, it has pulled in the weakest signals a bit better than the Kenwood but this is marred by the additional noise. The noise eliminating characteristics often make or break a receiver in my opinion. The R-8500 is "good" with HF, don't get me wrong,,, but it could be that tiny little bit better. I would say that a good antenna would make that difference - I only have a small vertical for my HF work,,, but then again, that's what good reicivers

should be made to handle - any old antenna...
Kenwood TS-570 = 100 points => Icom R8500 = 95 points.

Now VHF/UHF....
I have a few other scanners too. For everyday listening to V/UHF, I use my ameteur dualbanders - YUCCKKKKK - An opened up dualbander makes a TERRIBLE scanner, absolutely terrible. They drag in every little noise and adjacent channel and just make a terrible scanner but I have only a couple of frequencies I like to listen to, like most people I listen to "the boys in blue" (police) and the local repeater comes in nice and clear. However, when I want to do some serious listening I fire up the R-8500....
I also use an older Yupiteru MVT-8000 I have alongside it. The MVT-8000 works on any old antenna. If it picks it up on the lower VHF band, it will pick up the higher UHF (usually cellphones etc) on the same antenna. Any small whip will compliment the MVT-8000.... The R-8500 on the other hand is another kettle of fish... It is dead fussy on antennas on VHF/UHF... I would say immediately that a good discone or log periodic or some other multiband antenna will have to be used on the R-8500 in order to get its best performance to show up...
I only have a simple antenna system (it aint my house, you see) and I am allowed just one vertical for scanner work.

I have tried the following...

Dual band antennas - good for closely adjacent frequencies to ham bands but they go out of tune rapidly on the R-8500 AND guess what - I like to listen to frequencies quite a ways from the ham ones.... No surprise here.

Beams (yagis) - good for the desired frequencies but they rapidly go out of tune.

Stainless whips - kind of the best all-rounders without spending big bucks on a discone but they too can only provide a broad but not complete bandwidth.... e.g
I listen a lot to 75+ mhz 140+ mhz 460 mhz 485+ mhz and sometimes the cellphones on 870+ mhz, OK - Now it took me about a week to find the optimum length of stainless steel whip to provide the best all-round listening. I have about a dozen lengths from about 450mm (18") to about 1.2metres (about 47")... The shortest ones worked well on UHF and cellphones and the longest worked real good on 75 mhz through to about 160 mhz but no good on UHF and cellphone, NO GOOD at all.
I compromised on one of the middle ones about 600mm (2 foot). It works good on 75 mhz, adequate to good on 140 mhz and 450 to 460 mhz and moderate to poor on cellphone.... who cares about cellphones anyhow?

So I have the R-8500 compromised by a poor antenna setup, whereas the MVT-8000 goes well on any length/any frequency... You have to be the judge here.

The actual set itself,,,
The R-8500 has a million and one ajustments BUT it is so VERY very easy to set and forget. For this I give it 100%. Boy oh boy it is so easy to

program - easy peasy.... I didn't even have to read the manual to get all my frequencies in,,, Yes all 2 or 3 hundred of them in there respective banks - 40 memories to a bank.
HF, VHF or UHF,,, it was easy as pie to get the frequency, the mode, the step size and the other essentials all into their respective mem/channels.... Yes, definitely 100% for this... After this, some of the finer tuning settings took a quick scout around in the manual to find then again it was easy streets to perform and save
Ease of Use = 100 points

The R-8500 has many many features to enhance the listening. I think that's why it cost so much - it is very adjustable and programable.
It has (or should I say - Has not) one vital feature missing - A VFO... Yes you heard, No VFO... When I discovered this I was mortified. A multi thousand dollar receiver and No VFO. Wowww - what can I say???
After a few weeks of accepting this tragedy in design, I found that it isn't that bad with only memory channels,,, You can use each mem/channel as its own VFO without ever loosing the original memory contents,,, simply dial up, enter or adjust however you see fit to and then if you want to get back to the memory simply turn the mem rotary switch and you are there. Of course you loose the frequency you just dialed up which can be annoying if you really had to work hard to find but you soon get the hang of things.

A Serious receiver this IS. A scanner it IS NOT...
I read an article in this a while ago and the R-8500 was described as an HF receiver with VHF/UHF thrown in ontop as opposed to a scanner with HF reception... I agree... This is no scanner. It is an HF/VHF/UHF receiver and a good one.
If you wish to scan around and listen to all the many thousands of transmissions around then go and by an A.O.R desktop scanner or one of the many other desktop models for much less in price.
If you want a all-rounder monitoring station capable of picking out anything with a good antenna system then Yes spend the bucks and get the Icom R-8500...

Actually, no. You are disassociating yourself from that memory
preset.

> You will lose that
> frequency as soon as you touch the M-Ch knob.

True. But you rock one direction and back and you have your original
memory back. You have never actually changed the saved memory.

> As I said - You can
> effectively use each programmed memory channel as a VFO,

Actually, that you can't do. If you turn the tuning knob when
scanning memories (MEMO), you will go to the next/prev memory
to scan. If you turn the tuning knob when NOT scanning memories,
you will go up and down by the tune-step from that memory *BUT* the
memory is never changed. If you tune by the memory knob you go to
the next/prev memory, no matter what mode you are in.

> therefore
> theoretically giving you maybe up to 800 VFO's but it isn't the usual VFO

No, the "VFO" doesn't really retain a separate memory from whatever is
current.

> Maybe I haven't had the set long enough but I can't see any switch or

Closer to the Yaesu model, but there are differences there, too.
(Think of a hybrid between Yaesu VFO mode and MT mode and that's
what you have.)

How about "It has no VFO memory separate from the currently tuned
frequency" or "It has no independent VFO memory?" It certainly has
a VFO mode in my book.

More later...

With all due respect, since the "review" is a product brochure for the AR5000, I hardly expect it to be realistic. Reading it, it didn't even identify the ICOM by name.

I suspect the AOR is a fine receiver but with the exception of the '7030 I have no (NO!) respect for AOR's physical construction. ICOM always gets that part right, and mine have taken lots of abuse (physical, thermal) and keep on going. I doubt the AOR would've survived the mini-DXpeditions I've taken the ICOMs on...

But that's more an ergonomics issue than a feature issue. Set it in a
lower band edge with no value in the upper band edge and away it goes.

> Oh sure you can program your band edge for an upper and
> lower frequency and then let it do the job but that more like a specified
> search than a scan.

Just the lower. BTW, that behavior irks me, too. But for me,
the capability of scanning preset memories (MEMO), doing a band-sweep,
or scanning as you describe AND saving those memories away (which it
CAN do) is more important.

> I still see the set as a receiver first, a scanner second - just my
> opinion.

I still see them as orthogonal, i.e. independent. Just my opinion.
:-)

> Ever since I first started buying scanners (my first was a JIL SX-200 some

> 1. Those that scan from VFO
> 2. Those that scan memory banks

Yeah, Rich Wells calls those the search vs. scan types, and I think
he'd classify band searching, your scanning, and loading up
frequencies while band searching all as "searching" but going through
memories as "scanning." Rich?

> Many/most scanners incorperate both but the argument is - "Is the latter a
> scan or a search?" - In my opinion it's a search because it's defined by
> known frequencies stored in memory - whereas scanning looks for any working
> frequency.

Hmpf. I think that's backwards, but whatever.

> [...] but I still think in a
> true scanner you should be capable of hitting a "scan" button at any given
> point in time and letting the thing do its trick.

I think the definition of a scanner is just that it is capable of
from frequency to frequency rapidly and stopping on an active one.
How it is guided from frequency to frequency may depend on band
edges, memory, crystal, or tuning step/band plan. But the "how"
isn't what makes it a scanner. Remember, early scanners just used
plug-in crystals but wouldn't qualify by your definition... :-)

> I am glad I bought my R-8500 as it "Is" a masterpiece of modern radio
> technology but in my opinion the above VFO/Scan feature would have topped

515. Re: "floating" trunk data channel??

Newsgroup: rec.radio.scanner
Date: 2000-10-10 00:00:00 UTC
From: Rick Kunath <rskunath@portup._com>
Message-ID: <04NE5.61416$Sr.62012@newsfeed.slurp.net>
Source record: 78007

One thing that seems to have been overlooked in the discussion of control channel rotation, is the fact that all of the transmitters in the constellation are coupled to the antenna through a high-Q transmit combiner. A transmit combiner is a bank of high-Q (extremely selective) band pass cavities. These cavities are selective enough to pass the transmit frequency of a given transmitter, but not the other transmitters in the constellation. The effect of this is that each transmitter thinks that it is coupled to the antenna alone. No transmitter sees the others. Because of the selectivity of the cavities that the transmitters are coupled to the antenna through, the transmitters *cannot* change frequency. Should a transmitter change frequency without a cavity retune (this requires an on-site visit from a field engineer), it would see an extremely reactive load. It's output stage would reduce power output due to a high SWR, and no RF would be passed through to the antenna. If the control channel rotates, and some systems have implemented this, it is by rotating the duties of control channel between several different transmitters at a particular site, or different sites. Keep in mind that no matter which site or sites are used, the transmit antenna is almost always shared by a number of transmitters, all coupled through a combiner. This allows a number of transmitters to share an antenna with a premium location on the tower.

I hope that this has helped in the understanding of the setup at a commercial trunking site. Receive is handled a bit differently.

Rick

Sometimes you will not need 10 db, and this can cause paging towers to over drive your scanner on VHF H and interfere if gain is to high. I use a Radio Shack 15-1109 adjustable gain
(3db to 20 db).

This amp is powered from inside your home through the cable to a unit at the base of the antenna. That way the signal is amplified "from the antenna" through the entire cable. Rather than amplified at the radio only. This helps make up some of the signal loss in the cable.

How ever you can not transmit on the antenna with this unit attached at the base of the antenna.

That's very interesting since my R2 has a very robust front-end. I did some side-by-side comparisons with a Yaesu multi-band HT that has wideband receive, and the Yaesu was picking up
television audio on the aircraft band. I could tell by the tv channel and the rig's IF frequency that it
was an intermod problem. The R2 did not "hear" anything with the same telescopic antenna that the
Yaesu had. I have yet to have an intermod problem with the R2 here in a NJ very developed area.
And there is a commercial pager across the street from where we did our testing, and the pager overloads a couple
of my RS scanners.

This is typical of Icom...

It usually takes a few "test" models before they finally get it right.

The R-3 looks to me to be emerging as a major "gimmick" radio, and
will probably go the way of the R-1 until it's next incarnation, which
will include a built in DVD player and microwave toaster... 8)

I had a ham friend of mine who left his 2 meter mobile transceiver on all the time. He said he never had a problem with his battery going dead. When receiving, your scanner won't suck that much juice out of your battery, but as a rule I always turn mine off when I leave my truck since I never know how long I'll be away from it. I'd rather not take any chances.

Then where would the transmitter be for the frequency that is no longer being used as a control channel? Jamie is correct. Every channel has its own transmitter. Sometimes they are all in the same location, sometimes not.

Who said anything about physically swapping out transmitters?

There is already one transmitter per frequency. (If there weren't, all
the freqs couldn't be in use at the same time, so they wouldn't have so
many frequencies...) To put the control channel on a different freq you
just send the "control channel" modulation to a different transmitter.

Having the control transmitter change frequency (and another change also
to maintain the channel set) would have the observed effect -- the control
channel would move around -- but not the desired result; you would still
be running the same transmitter at 100% duty cycle, 24x7x52.

On the Percon database they have the Brown County Life Squad listed as 72.160Mhz for Georgetown, 75.620 for Mount Orab 75.720 for Ripley and 155.160 for Georgetown. Check the Percon database out at: http://www.perconcorp.com/scripts/foxweb.exe/SRCH_ENG?\0\FCC\RS_County\SPECTRUM\SPECTRUM

What a great resource.

Good luck,
Mike

I purchased an R-3 from HRO last week. Had to return it because of extreme intermod on LA County Sheriff frequencies. Commercial bands also had pager intermod. Looks like Icom didn't do something right.

$$
It's not enough to just save the emails and read them. He has to post them
for the world to see. "Look at me" "I'm the best".
Big head syndrome! Not just a few of them either..... 40 or 50!

Just look at the first page.... "over 2900 visitors a day!"
Professional websites don't use visual counters. Go to CNN.com, Eham.net,
Perconcorp.com, or qrz.com and see if they have counters. Not any that you
will see. They don't need to boast how many hits! Not only does SS boast
hits but he also post every now and then....."over 1 jilllion MB transferred
this month". Honestly, who gives a shit? So he has had over a
half million hits in a year, Some sites get that in a day!

You suckers can be fooled but not me. Bandercom, Javiation, and Scanners
Unlimited owns a piece of SS.
Free radios = good reviews, plain and simple. You might not give it a
perfect review but you sure aren't going to give it a bad one when it free!
Hell, send me all the free scanners you want and I will write 4 page reviews
on them all day long.....

Let me close by saying.... Rich's site is the best site for scanner
information. If you are buying a scanner look there first but don't *just*
look there. Do your own research on the web and get other opinions. Just
because he says its great or bad doesn't mean its so.

Hi everyone! I've just installed a PRO-2050 in my car, and I have a couple of questions:

1. Do you leave your scanners on all the time, or do you shut them off when the car is not running?

2. Have you had any problems with temperature extremes? My vehicle will be out in the cold, and I don't want to have to pull the equipment out all the time. Ideas?

Thanks!

550. Tinted windows and Glass Mount Antennas ????

Newsgroup: rec.radio.scanner
Date: 2000-10-10 00:00:00 UTC
From: thuynh6969@aol.com
Message-ID: <20001010153533.08756.00001008@ng-cu1.aol.com>
Source record: 78092

I just bought a Larsen glass mount antenna, in the instruction it states that
the antenna shouldn't be installed where there is dark tint or tint in general.

Is this because of the metal content in some of the more expensive tints or
just because of the thickness of the tint ?

My tint is the cheap kind and as far as I know it, contains no metals.
I would like to try to install the antenna over the tint Ihave very dark tint.

Any comments would be appreciated.

Thanks !

1. I have always hooked my scanners up to a manual power switch so I
could turn them all on at the same time. That gave me the option to
leave them on when the ignition was off, but still let me kill them
with one action.

2. Cold weather never seemed to bother any scanner I've owned (and I
go back to the original Bearcat before they gave it Roman Numerals).
Heat places the devil with the LCDs, though.

I would at least use a razor blade to cut a small square where the antenna will mount. That way you don't have to worry about the tint effecting the performance of the antenna. If you ever take it off it will just rip the tint anyway.

Source record: 78096

Not quite right. Napster and DVD lawsuits are not about decoding, but about copying and distributing copyrighted material. Radio voice communications are usually not copyrighted, so there isn't any relation to Napster or DVD here.

Instead, certain types of communications (e.g. telephone and paging) fall under privacy protection laws. But you're not breaking any laws by simply receiving it. What's illegal is USING and DISCLOSING private information. It's also illegal to decode ENCRYPTED (or SCRAMBLED) transmissions, because encrypted information is considered to be private by default.

As far as analog vs. digital argument, it's irrelevant because nothing is broadcast "in the clear" over the radio waves. Some kind of modulation is always necessary, be it analog (FM, AM, etc.) or digital (FSK, DSSS, etc.), or both. Note that digital modulation in itself is not an encryption. So as long as transmitted information is not copyrighted or private, it's always legal to receive it.

Which part of NJ Transit, rail or bus? Bus uses 800 mhz trunking and
rail is your normal 160 mhz freqs.

I notice quite a few people keep their freq and callsign data in Spreadsheet formats, and I wonder why. Am I missing something about that format?

For years I have kept my freq, callsign, DSN number, airbase databases in a database file. This enables me to make multi-field searches, i.e., using multiple search criteria. I experimented a bit with using Excel format databases that were sent to me by others and I found that the format was not as powerful for searches. Also unlike my database files that display the information fields on one screen, the spreadsheets require scrolling across the screen to view all of the fields (i.e., columns). Am I wrong and missing something. Have later-day versions of Excel incorporated features that allow for multiple search criteria? Also do they allow a line from the spreadsheet to be reformated so as to display all of the columns of that line on a single screen?

Hi Al!

This is a mystery to me also! Database applications were one of the first things I learned on computers, back in 1980, as it seemed so useful, for so many things. I used dBase-II, under CP/M, when it was owned by Ashton Tate! Although I currently prefer Fox Pro, I'm being forced more, and more, to use Microsoft Access, due to it being so common in business.

I think you'll find spreadsheets more common with many people because that was what they first learned how to use...probably to figure out how they were going to pay for their new computer! Being a database user, I'm sure you have no problem importing spread sheet data into your database application. It's funny, I know very little about spread sheet applications after all these years. Like the people using spread sheets for databases, I was using database applications to do the work of spread sheet applications. Go figure? (No pun intended!)

Hi All,

I have two radios that WILL receive APCO 25 digital transmissions.

I am selling two ASTRO Spectra mobile radios that are APCO 25. Both radios
are BRAND NEW and UHF with 482-512 Mhz coverage.

I am selling the radios for $1,500 each.

Using software such as WinScan, it is very easy to program a frequency list, and functions into a BC245-XLT. But that's not the only advantage of a BC245-XLT over a BC235-XLT...the BC245-XLT is a dual mode scanner, meaning you can scan trunked, and conventional frequency banks at the same time!

I know there are various and sundry programs out there that you can use with a Hamcom type interface to view unencoded digital signals from a variety of sources. The benefit of these programs is that they take the data stream and format it to make sense given the type of signal the program is expecting to monitor.

What I'm looking for however is a program to just decode the data stream (be it FSK, or whatever) and show you the raw data on the screen. To kinda rephrase what I'm asking (it's late and I might not be doing too good of a job explaining) rather than a trunk tracking program that figures out the commands it hears and takes action on them, how about a program that just shows the actual data itself on the screen regardless of format.

In this manner you could scan around looking for digital signals and then just see a subsequent stream if you found any. Of course you'd have to know what encoding it was (2 level FSK, 4 level FSK, manchester, whatever). Any sort of a software developers kit would be even better because then I could write my own.

I'm guessing that what we're really talking about here is monitoring the pin of the COM port that the Hamcom is connected to, watching the high/low transitions, and assembling bytes based on those high/low transitions? For 2 level FSK I'd think that would be not so bad (FSK high is high on the pin and FSK low is low on the pin), but for 4 level FSK, what does the interface do to represent the 4 discrete levels?

Obviously I have a lot to learn here, but I'm willing to try if some knowledgable soul will point me to some good reference materials.

Ah - Correct. Yes you can quite easily grab ahold of that huge tuning
knob and twist to your hearts content and tune up on anything BUT all you
are doing is changing that particular memory preset. You will lose that
frequency as soon as you touch the M-Ch knob. As I said - You can
effectively use each programmed memory channel as a VFO, therefore
theoretically giving you maybe up to 800 VFO's but it isn't the usual VFO
in my book - that is -> a VFO where you can dial up/tune up a frequency
then maybe go to you memory channels then return to the VFO and still
retain your frequency.
Maybe I haven't had the set long enough but I can't see any switch or
button with = M/V (memory/VFO) or similar on it like on the Kenwood sitting
right alongside it or the Yupiteru scanner on the otherside.. or like on
the many scanners/receivers I have had in the past... Perhaps I should
have said - It doesn't have a standard VFO, one which is used solely for
tuning in on a frequency and retaining it until changed by the tuning knob
or keypad, rather than changing a preset memory channel then losing the
frequency as soon as you change mem channel..

I change my statement - The R-8500 has VFO but it doesn't not have a
dedicated VFO mode as opposed to a memory mode.

>I beg to differ. Twice.

That's fine by me. No need to wear any fireproof underwear. You are entitled to your opinion just as much as I am to mine. It is just possible that I haven't played around with my set long enough yet but I have seen scanners which are more dedicated to, well, open scanning, more than this one. Yes there is the up to 40 ch/s feature but they are band edge or group scanning. Yes, still scanning but I haven't yet seen how to tune up a frequency and then push "scan" and let it run without having to store that frequency first. Oh sure you can program your band edge for an upper and lower frequency and then let it do the job but that more like a specified search than a scan. To me "Scan" means just that - to press the "Scan" button from VFO and let it run and as I said, it doesn't have that feature. Now if you wish to reply to that and tell me that it does then I might find out something more about the set. No hostilities from me. I am into learning as much as anyone else.
I still see the set as a receiver first, a scanner second - just my opinion.
I have not owned an AR-5000 or Lowe HF-150 so I can't comment on these sets in comparison. The R-8500 is the first scanning capable VHF/UHF receiver that I have owned that does not have a MEM/VFO button on it. Not to say that there aren't any out there though...
Ever since I first started buying scanners (my first was a JIL SX-200 some 18 years ago), I can remember a raging argument in books and writeups about what the word "Scan" defines and what a "Scanner" truly is. There were always 2 sides to this argument...
1. Those that scan from VFO
2. Those that scan memory banks

Many/most scanners incorperate both but the argument is - "Is the latter a scan or a search?" - In my opinion it's a search because it's defined by known frequencies stored in memory - whereas scanning looks for any working frequency.
I always liked the former over the latter whereas the R-8500 is definitely the latter because you can't scan until something is programmed, either a bank of memories or a lower/upper frequency band. My Alinco receiver has many memory channels and yet I have NOT got one of them programmed but I do use this as a scanner from VFO - just turn it on, keypad in a frequency and hit "Scan". If I like the frequency it lands on I stop the scan, if not, I let it carry on - I can't do that from the R-8500...

Of course now that argument can be augmented by more modern additions to scanners like band edge scanning and programmable searches and the tidal wave of other features which are available nowadays but I still think in a true scanner you should be capable of hitting a "scan" button at any given point in time and letting the thing do its trick. If it's in MEM mode then all the mem/channels will be scanned. If it's in VFO mode then it just scans until stopped. Every transceiver/receiver I have on my desk right now DOES except the R-8500. I have 10 other radios which WILL do just that, icluding Icoms own IC-R10 H/H, an Icom Dualband Txcr and many more...

I am glad I bought my R-8500 as it "Is" a masterpiece of modern radio technology but in my opinion the above VFO/Scan feature would have topped it right off as an even better receiver. It is fully tuneable and programmable as I stated and I am sure it can even make me a cup of coffee somewhere. I just miss this one feature...

Hey, the guy is getting value on these replies isn't he?

Congratulations Richard - welcome to the club.
Despite all I have said (not criticized) I think the R-8500 is a wonderful set and it is the flagship of my receivers. I merely tried to provide you with an objective point of view - "The Lowdown" as it were...
Everyone has a right to know the good and the not so good when parting with that sort of bucks.
I also have the RS-8500 software to control it from my PC and although it too has its faults, it is ok, although you have to be a bit careful about programming individual memory channels from the PC or you may well overwrite the wrong channel. It has a nasty habbit of not displaying the correct channel info, leading you to believe that you are in a particular memory number when really you aren't. The single best feature of the software is that you can reprogram all the memories from stored backups or tailored memory sets from the PC, in the blink of an eye... Apart from that, the R-8500 is on the desk so I prefer to use it rather than the PC to control it....

Oh yes... I found my RS-8500 software on the internet, free... I can't remember the address but I will look for it again if you wish - you may wish to get it too.... There are a few controlling software packages on the net but most of them are made by Hams (of which I am one) and they aren't the best, often requiring massive amounts of time to either set up or operate. They are mostly free demos, thank heaven, as I wouldn't pay for any of them as they are not quite up to the task. The RS-8500 controller is by far the best but it too could do with some refinements... Besides, why not just use the receiver where it sits.

Once again - Congrats on your new radio.....

I have an old scanner circa 1980. My mom new I wanted one for a while so she bought this second hand and sent it to me. It does not seem to work very well though. Should I just junk it and buy a new one. Perhaps I have the wrong codes??
Also any good sites suggested on where to find state by state codes?
Newbie to owning a scanner.
Heidi

You will find some info on that matter via
http://www.radio-portal.org

It is a search engine especially for radio amateurs and short wave
listeners, with more than 17.000 links. All links were checked, so no junk.

Just do a search for Shuttle within the category "Frequencies".

BTW: You will find lots of scanner frequencies by clicking on "Search in
broad", and combining the categories "Scanners" AND "Frequencies".

You can choose from 60 categories for such searches. This way you will find
many useful URLs. Reviews on receivers, frequencies for scanners, addresses
of domestic and international broadcasters, DXpedition pages for hams... 60
categories to choose from.

Try it and have fun.

If the 4 on the roof are laid out in a square pattern and are identical,
they're probably Lojack direction finding antennas.

Unless you have a very long cable run the amps can overload the scanner.
Also, the amp can be overloaded easily by nearby transmissions & cause
crosstalk (intermodulation). Finally, the noise that occurs in cheap TV amps
might actually cover up weak signals your scanner could otherwise hear. They
use very cheap transistors in most consumer type TV amps.
An amp from a ham radio shop or scanner specialty shop could be better. A
good one will have a "noise figure" listed and it should be less than 1-2 db on
VHF High band and less than 2-3 db on UHF if you can afford it. Ratings better
than that are expensive, but can be noticable.
When you look at high quality amps, the cost of a good outdoor antenna and
coax looks smaller. You might check Radio Shack, I saw an outdoor scanner
antenna on clearance for $10 there last week.

PA-Sit-Rep is a Pennsylvania state-wide e-mail list open to anyone willing and able to abide by the list posting protocol. List members are encouraged to invite other participants to join the list. List messages consist exclusively of those made by the voluntary list participants.

The purpose of PA-Sit-Rep is to keep all list subscribers up to date on emergency activities and situations of MAJOR import throughout the state of Pennsylvania. The list is a free communications tool that will enable you to monitor situations throughout the State of Pennsylvania including weather emergencies, natural disasters, environmental disasters, police activities (major emergency events only), civil disturbances, political developments (ONLY OF THE MOST MAJOR IMPORT) and military activities such as urban exercises.

List members are encouraged (but not required) to send reports to the list pertaining to any of the above activities. Only reports pertaining to Pennsylvania situations are permitted. The PA-Sit-Rep list is extremely low volume because posts are limited to emergency situations of only major import and those which are relevant to Pennsylvania. PA-Sit-Rep is not a discussion list nor is it run from a commercial server (so you won't have to scroll through commercials in the messages).

PA-Sit-Rep may be of particular interest to individuals in the state of Pennsylvania who own wireless devices capable of text messaging. The list protocol is designed to accommodate these devices, which are usually either text capable pagers or Digital Cell Phones and are of limited message length capacity.

Any questions regarding list protocol should be directed to: pa_sit_rep@yahoo.com and the subject line of the e-mail should read: "PA-Sit-Rep"

Or, visit the PA-Sit-Rep web page: http://www.1stpa-militia.org/sit-rep.htm

You may subscribe to the list at the above address or by sending an e-mail to:

pa_sit_rep@yahoo.com

with the word "Subscribe" in the subject line and the e-mail address you would like to have subscribed in the message body.

hello to the group: i have a pro-2002 programmable (50 chnl) scanner
that suffered damage to the keypad; unit powers up, display shows error
message, and it appears that NO keys input any info at all; it looks
like some type of very hot instrument was "wiped" across the keypad,
melting some of the keys.
question: what to do w/ this unit? any ideas as to some use for the
remains (will offer for parts later if nothing else)? obviously waiting
for another cheap unit as parts for this one, but why, i have better,
later model units?
just wondering what neat ideas are out there for this unit.
tnx,
barry

"sue me" <sueme@court.net> wrote:
> ... certain types of communications (e.g. telephone and
> paging) fall under privacy protection laws. But you're not
> breaking any laws by simply receiving it. What's illegal is
> USING and DISCLOSING private information.

The following is an (updated) dissertation on the various laws and
their effect.

The laws of the United States, passed by Congress, are codified as
the United States Code (USC). It is divided into titles covering various
subjects. Title 18 includes the criminal laws and penalties; Title 47
covers telecommunications. A law can be refered to by its original name
(i.e. "The Communication Act of 1934") or its entry in the USC. A specific
section would be refered to by title/USC/part/section, i.e. 47 USC 605.
To carry out the law, government agencies create regulations, which are
codified as the Code of Federal Regulations (CFR). It is likewise divided
into titles, with the FCC's rules in 47 CFR.

18 USC 119 bars the disclosure of any electronic communications to
which you are not a party (with certain legal exceptions), and sets the
penalties. 47 USC 605 (the Communications Act of 1934) also bans the
disclosure or use of third-party communications. With minor changes, this
has been the law for 65 years.

In 1986 Congress passed the Electronic Communications Privacy Act (the
ECPA), which added definitions to the law that banned listening to cellular
telephones. It also banned the monitoring of broadcast auxiliary, SCA and
scrambled signals.

In 1992 Congress passed the Telephone Disclosure and Dispute Resolution
Act (TDDRA), which instructed the FCC to ban the manufacture or import of
scanners capable of receiving cellular. In accordance with this law, the
FCC modified 47 CFR Parts 2 & 15, effective 26 April 1993. Note that this
does not affect the sale of such scanners, so long as they were made or
imported before the cutoff date.

On 25 Oct 94, the Digital Telephony act was signed. Buried in one of
the additional sections was a change to 18 USC 2510 & 2511 that added
cordless phones to the original ECPA ban on receiving cellular.

In April 99 the FCC revised 47 CFR 15.121 so that any cellular mod,
even to one's own or a pre-ban scanner, constitutes manufacture. They
also required manufacturers to make the tuning and control components
inaccessible, and limited the reception of cellular images.

In short, it is illegal to:
Manufacture or import cellular-capable scanners;
Modify a scanner for cellular reception;
Listen to cellular (and cordless) transmissions;
Divulge any communication to which you are not a party.

The fact that the R3 has video reception capability should greatly affect how it handles intermod compared to the R2 and your Yaesu HT. This is going to be a common gripe among early acceptors of this technology. Like all next-gen gadgets, the R3 and the technology behind it will improve with age.

The recorder output jack on the Icom R7000 is just a switched relay inside the radio used to turn a remote tape recorders on when the squelch breaks. Nothing but an remote switch controlled by the squelch. AN audio signal isn't going to cut it.

We might want to split the job in two:

1) Getting the raw bit stream out of the signal.

2) Treating this bit stream according to protocol specifications.

I think it was 1) that the original poster asked about.
To my knowledge there does not exist any general "toolbox" software,
that can be used. Some software like Radioraft has the ability to
display raw data, but this is limited to the modes actually supported
by the software.
What we need is a tool, that allows us to specify things like
modulation method (FSK, FFSK, GMSK etc.), bitrate, mark/space
frequencies and possibly other parameters.
There are lots of software out there, that as part of their
functionality implements a fixed set of these parameters. It surely
should be possible to develop a more general tool which probably
already has been done as part of some of the packages supporting
lots of decoding modes. Unfortunately there are no freeware og
shareware tools available.

Personally I would like to se a toolbox supporting sound cards
on a PC. This would make it possible to develop applications, that
would run without extra hardware.

Regards
Per

I have used my scanner in my vehicle before, and have been pulled over by the police for a citation. They saw the scanner and knew that I was listening to them and said nothing about it.
It's pretty common sense, so long as it doesn't distract you from your driving or you don't use your scanner to commit any crimes or to assist another to commit a crime, you should be okay. Sorry i don't know the specific Penal Code sections.

I'm interested in the free software package you have for the 8500?

My NRD-545 runs circles around my 8500 on HF.
In fact I don't even have a HF antenna connected to my 8500 any more.
I use it for >30Mhz only

Joe,

I think what you are looking for is software that generates the "bits". That is the stream of 1's and 0's. Converting that into any kind of text depends on the protocol. In other words if the stream being sent is ASCII, then 7 bits make a byte, or the 1010101 is one byte that represents either 1-9 or A-Z. The second set of 7 bits is the next byte and so on. Other protocols do it differently. That's as far as I can explain it. If you want to see the bits being received (1's or 0's) then you can use Radioraft. One of its modes produces the raw data. Hope that helps.

Subject: Evidence John Mackey Lied About His "Articles"
Content-Type: text/plain; charset=us-ascii
Content-Transfer-Encoding: 7bit

OK Toilet Boy, you say you've written lots of articles for the
ARRL and other technical journals. The ARRL does not show you as
author for anything and no articles in ANY technical journals
have been found. Here is the proof that you lied about your
articles.

Several people have visited the ARRL Web Site (www.arrl.org), and
searched, finding nothing written by you. You claim they used

faulty search methods. Here are the results of my search of the ARRL Web Site using "john mackey" and "ka0ssf" as search parameters. Before you get all excited and claim my search method was faulty because I did not use any capitalization, the search engine is case INsensitive.

Regarding the search for "john mackey," the first, third, and fourth hits showed only because of "John" and "Mackey". The second hit refers to The ARRL Letter for July 5, 1996. That was the issue the contained the item about PARG catching a jammer.

Regarding the search for "ka0ssf," the only hit was a duplicate from above.

The original article appeared on the PARG web page (www.parg.org) does not credit you as the author. That article is reproduced below in its entirety. The next article is from the HamRadio Online website (www.hamradio-online.com), also reproduced below in its entirety, does show you as author. Finally, the item in The ARRL Letter is shown below as well. It does not credit you as author either.

It is interesting to note that the HamRadio Online piece appeared in the June 1996 issue and the PARG piece appeared in July 1996. Why would your own group not credit you with authorship? Why would you use the email address of someone else (mscott@teleport.com) instead of your own? Oh yes, I remember now. That was the time (March through August 1996) that you were using one of eight bogus addresses because you were stealing Internet access. Let's see, you were using the addresses:

John.Mackey_Jr@p234.f40.n105.z1.fidonet.org
John.mackey_jr@p234.n40.f105.z1.fidonet.org
Here.now@present.com
no.address@anywhere.com
no.address@anywhere.gov
No-place@anywhere.org
no--place@any-where.com
no__place@any__where.com

Comparing the three articles side by side, it is very clear that the first article, which appeard in HamRadio Online, was reworked for the PARG web page. Then the ARRL edited it for their use. No matter how you slice it, you have not written several articles, as you've claimed.

Again, Toilet Boy, you lied.

And now, the evidence:

Amateurs Locate Police Jammer in Oregon

by John Mackey, KA0SSF, mscott@teleport.com

During June 1st, 1996 in Seaside Oregon, where the SEA-PAC ham
convention was being held, a group of hams belonging to PARG
(Phantoms Amateur Radio Group) were down on the beach front
enjoying the annual PARG bonfire. One of the hams (KB7YZS) was
monitoring the local Seaside Police Dept. He heard someone
cursing and yelling at people. At first he thought it was
coming from the UHF side on his hand-held transceiver, but to
his surprise it was coming from the VHF side which was
monitoring the police.

He promptly notified everyone at the bonfire to listen. After a
few minutes of listening to the person, the members had figured
out that the person was up in a balcony, was with 3 or more
people and 2 of which were females. They realized this because
of key things he said and voices in the background.

The 4 PARG members in the group (KB7YZS, KB7YZR, N7XMD, and AA7UP)
just happen to be most of the PARG Interference Committee. They
immediately activated the PARG Interference Committee direction
finding operations. They promptly tracked down the interference
to a specific location of the Shilo Inn and searched for someone
matching the description. After only 5 minutes they saw a group of

people on the third floor of the Shilo who matched the description. Then they saw him pick up his hand-held transceiver and speak into it. At the very same moment the voice on the police frequency was saying "Hey, fat ass, yea you in the black pants and the white shirt". While he was saying this on the Seaside Police frequency the members noticed a man wearing those clothes, a little on the heavy side walking directly underneath them.

One of the PARG members saw a Seaside Police patrol car in the area. A PARG representative approached the officer and asked him if he was looking for a person causing interference to the Police Frequency. He seemed very upset and replied "YES"! The PARG representative then informed the Seaside Police Officer where the malicious interference was coming from. Three other PARG members were on their way to the third floor when they saw the people (from the room/balcony where the interference was) come running down the stairs and away from the Shilo.

The officer took a report from the PARG representative, including an exact location of the motel room and spoke to the hotel manager. After 2 hours the interference started up again. The Seaside Police Officer went directly to the room the PARG Interference team pointed out and caught the person in the act of doing the deeds.

The above is known to be facts. The above mentioned is knowledge from speaking the PARG Interference Committee members and to a friend of the suspect.

The man who in is question has a call sign of KE6VNU and is from Central California. He apparently was in Oregon for the ham convention. Information indicates he was released from jail only a short time before this incident, the charge he was in jail for was malicious interference to the local police in his area. This obviously did not teach him his lesson. We understand that he caused a great amount of interference to the Sacramento County and Roseville emergency/public services communications and often identified himself on those malicious transmissions as "The Phantom Jammer". We were told the charge Seaside Police brought against him was "Interference of a police officer in line of duties".

Note: It is an unfortunate coincidence that the malicious interferer used the name "Phantom Jammer". He has absolutely NO association with or relation to PARG (Phantom's Amateur Radio Group), the group which located him & turned the necessary information into the Seaside Police which led to his arrest for the interference. We did not release this information until now at the request of the local law enforcement officials to prevent tainting their investigation.

This was PARG's second year in a row of providing public services during the Seaside Ham Convention. Last year several PARG members

apprehended a purse thief (after a brief foot pursuit), returned the purse to the rightful owner, and detained the suspect until police could arrive. PARG also performed crowd control activities at this time due to the large number of people who stopped to watch the purse thief incident.

PARG is the Phantom's Amateur Radio Group in Portland, OR and is Portland's most active VE testing, repeater club, emergency communications, and ham radio group. Please visit our web page at http://www.teleport.com/~mscott/dumb.shtml.
You can contact PARG at

PARG, PO Box 1586, Beaverton, Oregon 97075-1586
Phone 503-818-PARG (24 hours)

The PARG Crack
The Official Newsletter of the Phantoms Amateur Radio Group
"We are anything but complacent"

July 1996 - Portland, Oregon - ONLINE EDITION

Interference Committee Stops Californian Jammer

The SeaPac ham convention was saved once again by PARG representatives. In a valiant effort to restore peace and safety to the coastal community, members of the PARG Interference Committee assisted Seaside Police officers in the apprehension of an individual jamming their dispatch frequency.

During the annual PARG bon fire, several members of the Interference Committee were monitoring the local police dispatch frequency. As they were completing a safety check of the area before returning to their accommodations for the evening, the Committee members heard someone sending malicious transmissions on the VHF dispatch frequency. Immediately, the field operations of the Interference Tracking Unit (ITU) were activated and the search began for the jammer.

After a relatively short and efficient investigation, the ITU determined that the illegal signal was originating from a shore front hotel. This information was derived from both direction finding techniques and verbal clues left by the jammer.

The group immediately broke into two teams and sent a representative to contact a police officer who was patrolling in the area. The other team went to the hotel from which the suspected jammer was transmitting and watched his room for a

possible escape attempt.

Soon after contact was made with the police department, the suspects were seen going down the hotel stairs and away from the building.

During the time that the suspects were out, the jamming ceased. About two hours later, the jamming started up again. When this happened, the officer the PARG representative had contacted returned to the room and apprehended the suspect.

According to reliable sources, the suspect, KE6VNU was arrested by the Seaside Police Department for the charge of Interfering with a police officer in the line of duties. In addition to being involved in this situation, the jammer was allegedly involved in similar activities in Sacramento County, California.

The outcome of any prosecution will be covered in a later edition of the PARG Crack.

========== Article from The ARRL Leter, www.arrl.org =========
========= July 5, 1996, reproduced without permission ========

PHANTOMS HELP NAB "THE PHANTOM JAMMER"

The Phantoms Amateur Radio Group (PARG) of Portland, Oregon, is claiming credit for helping police to nab "The Phantom Jammer," who was interfering with police calls in Seaside, Oregon, during the Northwest Division Convention in early June. John Mackey, KA0SSF, of PARG reports members were on the beach enjoying the annual PARG bonfire when KB7YZS heard someone "cursing and yelling at people" on the VHF police frequency, which he was monitoring at the time. After a few minutes of listening, members figured out that the person was up in a balcony and was with a mixed group. KB7YZS, KB7YZR, N7XMD, and AA7UP (who just happen to be most of the PARG Interference Committee) immediately activated direction finding operations and tracked down the interference to a local motel. It only took them a few minutes to spot a group on a balcony, one of whom was using an H-T. After noting that the transmissions coincided with what they heard on the police frequency, PARG informed Seaside Police. A short time later, Mackey reports, Seaside Police "caught the person in the act."

Seaside Police subsequently charged Bobby Lee Aguero, KE6VNU, of Rocklin, California, with interfering with a police officer. As we've already reported in The ARRL Letter and in QST, Aguero, 19, already faces similar charges in California.

Mackey said this was the second consecutive year PARG got to provide a public service during the Seaside convention. Last year several PARG members apprehended a purse thief--after a brief foot

pursuit--returned the purse to its rightful owner, and detained
the suspect until police could arrive. PARG has a Web page at
http://www.teleport.com/~mscott/dumb.shtml. The group's current
president is Justin Bousquet, AB7NG.

Date: 1997/12/17
Message-ID: <19971217040221.25634@ns.sol.net>
Newsgroups: news.admin.net-abuse.usenet

This data has been gathered by Joe Greco and sol.net Network Services
as part of an ongoing project to monitor Usenet trends and abuse.

There are currently two items scanned:

1) "From:" header
2) "NNTP-Posting-Host:" header, if present

All articles sharing the same header (i.e. all articles with a
"From:" header of "jgreco@ns.sol.net") are counted together, with
a summary of the number of posts, bytes posted, and BI. Only
articles that have a BI of 20 or greater are summarized.

Please remember that BI is a general formula to measure the
number of groups posted to in a manner which favors crossposting.
The fact that the posts of a single poster may have a BI of 20
does not imply that the articles are spam, as each article may
have been completely different and unrelated.

Let's see, according to WhoWhere? <http://www.whowhere.com>, you've used
no less than sixteen obviously fictitious Internet addresses. These are
just the ones where you were stupid enough to use your callsign. You
might plausibly claim one or two were used by someone impersonating you,
but you can't claim all of them Toilet Boy.

In light of the abuse you've managed with fraudulent address, your
ragging on Bill Cheek about the WinRadio issue in the manner you
have been, makes YOU the hypocrite here, as usual.

That's an apples and oranges comparison. The time periods are not equal.
But, you're too stupid to understand such simple concepts, Toilet Boy.

==========
You claimed you were not the most proflic poster of off topic messages.
You lied.

With the aid of DejaNews, I have analyzed the quantity of postings by
several regular posters in the alt.radio.scanner and rec.radio.scanner
news groups for a one year period and compiled the statistics. The full
one-year period between August 1, 1997 and July 31, 1998 was examined
on a month by month basis. All the the people were subject to the same
search and level of scrutiny.

Seven people who are, or who have been accused, of being high frequency
posters were selected. Those people are John Mackey, Bill Cheek, Richard
Kendrick, Blake Bowers, George Vetterle, allsafe, and K4CC. The
addresses
used by these individuals were the seed for the search.

In the case of Mackey he has used ten different addresses during the
selected time period and all ten were used. Those address are:
jmackey@usa.net, jmackey@parg.org, kaossf@parg.org, jmackey@parxg.org,
jxxxmackey@uxxxsa.net, ka0ssf@premovearg.org, jmackeyremove@usa.net,
ka0ssf@paremoverg.org, and jmackey@pio.net.

Bill Cheek changed from cts.com to san.rr.com before the examined time
period and his posts from that domain are not included in this survey.
The address used was Bill Cheek <bcheek@san.rr.com>.

George Vetterle changed providers, but this only added five to his total
count of messages posted. The two addresses surveyed are:
geovet@ix.netcom.com and geovet@thevision.net.

The other address used were Richard Kendrick <wa7twi@primenet.com>,
Blake Bowers <bbowers@townsqr.com>, <allsafe@netwit.com>, and
<k4cc@aol.com>.

This is the quantity of postings broke down on a month by month basis
for each of the people named above. If a message was cross-posted to
both qroups, it was only counted once.

Date | Mackey | Cheek | Kendrick | Bowers | Vetterle | allsafe | K4CC

JUL 98 | 413 | 386* | 6 | 32 | 28 | 75 | 234

JUN 98 | 413 | 502* | 0 | 64 | 45 | 97 | 95
MAY 98 | 22 | 208 | 0 | 11 | 8 | 12 | 12
APR 98 | 194 | 128 | 27 | 41 | 25 | 12 | 0
MAR 98 | 254 | 240 | 49 | 24 | 50 | 18 | 0
FEB 98 | 200 | 274 | 51 | 27 | 46 | 18 | 0
JAN 98 | 173 | 178 | 35 | 1 | 33 | 33 | 0
DEC 97 | 149 | 227 | 32 | 0 | 16 | 1 | 0
NOV 97 | 63 | 65 | 1 | 0 | 10 | 0 | 0
OCT 97 | 48 | 60 | 0 | 0 | 8 | 0 | 0
SEP 97 | 181 | 78 | 0 | 2 | 4 | 0 | 0
AUG 97 | 29 | 2 | 0 | 1 | 2 | 0 | 0

TOTALS | 2139 | 2348 | 201 | 203 | 275 | 266 | 341

AVG/DAY| 5.86 | 6.43 | 0.55 | 0.56 | 0.75 | 0.73 | 0.93

AVG/ADJ| 5.86 | 6.43 | 0.95 | 0.74 | 0.75 | 1.09 | 3.72

The TOTALS are the sum of twelve months of posts for that individual.

The AVG/DAY is the average number of posts per day based on the formula TOTALS / 365.

The AVG/ADJ is TOTALS / SUM OF DAYS IN TOTAL MONTHS OF POSTINGS is the average number of posts for the actual days in the news group. The adjusted value is because some of the posters had a 0 for any given month(s).

The two months marked with an asterisk (*) for Bill Cheek are inflated values. The actual values are probably much lower because these values included the reposts of the messages canceled by John Mackey.

Consider this point. Less than two dozen of the total posts by Mackey pertained to scanners or scanning. Approximately half of the posts made by Bill Cheek were devoted to scanners and scanning. Now go back and look at the numbers again. You do the math.

For the others, between one-eighth and one-half of the posts made by them were pertaining to scanners and scanning.

I use WD-40 all the time on swiches (rotary, AC power, relays,
you name it), noisy potentiometers, sticky slugs in old UHF
rig inductors, locks, and anything else that slides or turns.
Doesn't hurt any of 'em. It's one of the Great Inventions of
the 20th Century (along with latex paint and plastic drinking
straws. .)

Subject: Proof of Bill Cheeks Mensa Membership
Content-Type: text/plain; charset=us-ascii

Content-Transfer-Encoding: 7bit

I have been able to verify that Bill Cheek did indeed once belong to American Mensa, as he claimed. In the 1983/1984 Directory of American Mensa Membership, there is a listing for William David Cheek, 235 Pike Street, Golden, CO 80401, (303) 279-1447. Bill Cheek was not listed in the 1985, or subsequent editions of the directory.

A check with the National Mensa office in Fort Worth, TX revealed the following facts about a persons membership. Once a person has qualified for membership, he is qualified for life. He may let his membership lapse at any time for any reason. He may then rejoin at any later time by simply paying the current dues. A members IQ does not drop as soon as his membership expires, as John Mackey would have us believe.

Gee, it looks like Bill Cheek DID tell the truth, unlike John Mackey.

On Wed, 11 Oct 2000 00:53:54 GMT, nospam@efortress.com (jeff) wrote:

It's funny you say that about your NRD-545 vs R-8500 for HF reception because the guy I bought my R-8500 off, sold his 545 and bought the 8500 and he reckoned he went up in performance with the 8500.. Now just personally, I can't see that to be honest.... I had a 525 and I was very happy with that... I played around with a 535 and was even happier and I "was" going to buy a 545 only the importer for JRC here, dropped the radio side and I think they now only concentrate on navigational equipment from JRC. I got a price for the 545 and it was going to be just a few bucks shy of the 8500 at the time, a year or so ago now,, but I decided to give the whole idea up for a while BUT then the radio bug bit me again and I had to ease the pain. I phoned the JRC people and as I said above, they no longer import them but they are available somewhere in the country, then I saw the R-8500 for sale in the local paper. I phoned him up, chatted for a while and koncked him down about $250 and we settled on a price. The next day I picked it up, after seeing that the set was in as good a condition that he promised it was. Purchase receipts revealed that it was a handful of months old, so I payed my money and owned a set.
It was while I was over there he told me he had previously owned a 545 and he didn't really like it. I was quite surprised at his summary of it, I didn't even mention that I was going to buy one either.

Strange how we can all find more to disagree with when the going gets tough.

Anyways enough small talk - I am happy with the 8500 as my base receiver/scanner and I use the Kenwood TS-570 as the HF receiver... The Kenwoods receive is without doubt the best I have ever listened to. Having many Ham associates and friends, I have sat next to and listened to many HF rigs and I reckon my TS-570 is is at least the equal to all of them and better than most..... many of them agree with me and of course, some don't...

Well said, Senior Chief, very well said.

The problem is one has to have been in the Navy or know something about
the Navy to know how badly you insulted him by calling him that.

Did you ever hear the word "billet" in your years in Sam's Navy? Did you
ever hear anyone use it instead of "rate"?

Kind of says it all, doesn't it?

LRod

Most 'anti scanner in car' laws (at least in California) tend to be county
or city laws, not state. So you'll have to research every single
city/county you intend to use a mobile scanner in.

Again, so what. You say "Professional websites don't use visual counters."
Right. Rich's website isn't a "Professional" website. It's a labor of
love, not a business. He does it because he's a radio fanatic, like many of
the rest of us. He's proud of his work (and he should be, it's d*mn good!)
so he brags a bit. I'll take his "boasts" any day over listening to some
new parents bragging about their precious darling. It's his site, he can
put any d*mn thing on it he feels like.

reviews
> on them all day long.....

What's next, you going to blow the whistle on Monitoring Times and Grove
Enterprises? Free demo equipment to evaluate and review is common in all
fields. Do you think Car and Driver or Road and Track magazines buy all the
vehicles they write about each month. No, they are supplied bu the
manufacturer for writer testing, then returned. The same thing at the
computer and stereo magazines. The equipment is loaned to the writer, and
returned at a later date. I'm reasonably sure it's the same with Rich. He

doesn't get to keep the radios he reviews. If he badmouthed all the equipment he reviewed, I'm sure the sources would dry up. But he writes reasonable and fair reviews, so it's in the dealers' best interests to assist him. I expect one or two vendors have gotten pissed off somewhere along the line and pulled their assistance, life's tough. The only two reviewers I know of who buy all their tested items at retail are Consumer Reports and the ARRL (who had an ad in the last issue of QST selling off the latest batch of reviewed equipment).

> Let me close by saying.... Rich's site is the best site for scanner

> look there. Do your own research on the web and get other opinions. Just
> because he says its great or bad doesn't mean its so.

This I won't argue with. You should never buy anything based on just one source's evaluation. Their ideas of good and bad might not match yours. Always check around.

I generally turn mine off when I leave the car. I don't like to attract any extra "unwanted" attention. But, as another post said, it's not a problem operation-wise as long as you have a good alternator and battery.

> 2. Have you had any problems with temperature extremes? My vehicle will

I have a quirky problem with my PRO-2026 in the cold weather, the squelch for the UHF (460) band acts like it's open when I first turn it on. Once it warms up, no problem. So I have been known to leave it on (with the volume turned down) when it's going to be cold, so I don't have to wait for it to "warm up".

Danny,

The way that I did this with my setup using the IC R10 was to run a audio lead from the headphone socket on the top of the scanner back to the mic input on soundcard for the detection. It works fine, but is a little slow to react at times. You just need a simple mono lead with 1/8" plugs to go from the soundcard to the scanner. I think the only other problem you may have might depend on what software you are using, just check to see if the software that you are using detects through the soundcard if it does then there shouldnt be a problem.

Cheers
Dick

639. AR-8000 Thermal overload

Newsgroup: rec.radio.scanner
Date: 2000-10-12 00:00:00 UTC
From: Eddie Bryant N4UMJ <N4UMJ@carolina.rr.com>
Message-ID: <pmjF5.13714$QB1.3487085@typhoon.southeast.rr.com>
Source record: 77950

I bought a new AR8000 and took it on a business
trip the next week to get to learn how to use in my spare
time. Also took my Pro-43 as well.
I left the AR8000 in my car and it was a hot day in July.
Anyway, I took it out of the bag in my hotel room to
finally get aquainted with it and found there were several
missing segments on my LCD display.
It had worked earlier so it most of had something to do
with the temperature extremes it was in.
Having no tools with me and this being the first day
of a week away from home I made a trip to the local Sears
and purchased a screwdriver set.
I took the scanner apart and reseated the flex connector
going to the LCD. Sure enough the problem cleared up.
I have never had this problem with any of my other radio
scanners.
AOR seems to demand top dollar but looking inside the scanner
case things begin to look a little on the economy side.
The means to hold the LCD display tight against the
board were nothing more than four bent metal tabs.
Faster assembly I guess to bend four tabs than screw in
four screws.
Most radios do at least use screws for that purpose.
Well it worked perfectly afterwards but I have my doubts
about their construction.
Also heard signals on my Pro-43 that were missing on the
AR8000. I believe the portable was being overloaded with
strong signals in the downtown area I was in.
The Pro-43 worked fine though.
I would tend to agree with Eric's statement below on AOR's
construction.

Just my experiences with AOR,
Eddie Bryant

I just don't believe it. I haven't checked this newsgroup in probably a couple of years. I stopped coming here because I got sick of reading all of the off topic crap from Mackey. What do I find? Mackey is still posting the same old useless tripe. The only thing that is really different is there is a whole new set of people who are sick of this pyscho.

Look take a tip from someone who has seen it all too much before. Mackey is a troll. He posts useless crap because it is his sicko way of filling the obvious void in his life. If you respond to him, he will keep coming back. That's what he has been doing for probably 6-7 years.

Well, looks like I should come back in another two years.

Oh, before I go, does anyone have cordless telephone freqs? Can I listen to digital signals? Can the PRO666 pick up the devil? Whatever happened to the case against Mackey for selling ham radio licenses? Who was Bill Cheek?

642. Re: AOR 8200 MKII vs Icom R-3

Newsgroup: rec.radio.scanner
Date: 2000-10-12 00:00:00 UTC
From: Eddie Bryant N4UMJ <N4UMJ@carolina.rr.com>
Message-ID: <KRkF5.13728$QB1.3521820@typhoon.southeast.rr.com>
Source record: 77953

According to Bob Grove of Monitoring Times Magazine
(October 2000) he says the following negatives about the R-3:

"-R-3 has no keypad for easy frequency entry.
-No USB / LSB or fine step tuning for shortwave listening.
-No auto-store search
-Has anoying squelch pop
-R-3 has high current consumption with TV on (880ma)
(i.e. keep a couple of spares handy)
-R-3 not as sensitive as the R-2
-Frequency readout smaller than the R-2
Bob Grove says the R-3's video is unique among portables.
The color LCD makes set-up for options easier.
The wide freq. coverage and CTCSS are useful.
and finally "The R-2 is a better choice if you don't require
video reception."
Surprisingly,the most interesting feature of this radio (video),
he failed to get it to receive properly at 2.4 GHz.
It did receive regular broadcast TV well ,although he said the
display washs out in bright sunlight.

This is only a condensed portion of his comments but
they are enlightening.

I think I will pass on this one until I hear more reviews on it.

From: meghertz@hotmail.com
Message-ID: <8s4odilkm1@nnrp1.deja.com>
Source record: 77957

Can anyone tell me please, is there any significant difference
between the Icom R2 and the transceiver version, the Q7,
in terms of scanner performance?

The number of memories doesn't concern me. A little bit worse
intermod wouldn't bother me as I'd be using it portable with the
stock antenna, out and about.

I've seen users rave about their wonderful R2s, and there are
plenty of happy Q7 owners but I'd like to know how they compare
in terms of usability. If I bought a Q7 might I regret not getting
the R2?

I saw one posting once along those lines, but it wasn't followed
up (or even very specific).

Any help appreciated, (Mr Wells?!)

657. The search for a gene...

Newsgroup: rec.radio.scanner
Date: 2000-10-12 00:00:00 UTC
From: analog24@webtv.net
Message-ID: <13101-39E678BA-62@storefull-177.iap.bryant.webtv.net>
Source record: 77968

GENETIC
FACTOR EYED

Biofeedback Systems in Los Angeles, is looking for
volunteers with a rare genetic inheritance, to participate in a
proprietary study.
At present, it is believed that fewer than one person in 400
carries a rare genetic makeup that predisposes them to having better
health than most, a strong immune system, and an unusually high energy
level. Aside from behavioral manifestations such as a generally positive
outlook on life, the principal evidence that this genetic factor is
present, is mirrored in the shape of the eyes.
It should come as no surprise then, that the eyes themselves
would be used to select the people who are nost likely to have this
elusive gene. Individuals selected for this study will be white,
Caucasian, of either gender, and between the ages of 25 and 50.
Compensation will be determined by a collective evaluation of the total
number of applicants selected. Drugs will not be administered as a part
of the study.
The eye contour that embodies the required genetic trait,
has been roughly described as "almond shaped," but this is not an
adequate definition. Exact specifications follow.
Looking in the mirror with the head level, the qualified
applicant will see that the lower half of their eyelid is CONVEX UPWARD,
from the bottom on either corner. The bottom part of the iris will be
partially covered by the lower eyelid (this is important), and there
will be a reasonable symmetry between the eyes on the left and right
side of the face.
Applicants must submit a close-up facial photograph for
evaluation. Since no risk or disease factors have been associated with
this gene, any risk to volunteers in the study is contraindicated.
Interestingly, it is apparent that the "energy gene" as it has been
called, may be dormant in one or both parents, yet it may be actively
transmitted to their children; but it is only infrequently active among
two or more siblings.
If you know of a person, or happen to notice one whose eyes
might qualify them for this study (preferrably among those employed in
the technical community), you may want to share this data with them.
Since so few people are fortunate enough to carry this gene, your only
encounter with one of them may be in a fleeting moment. It would be
wonderful if you had a copy of this announcement with you, and could
share it with a prospect in passing. Alternatively, you could specify
this website and posting date, or perhaps my email address.
They may then contact Mr. Norman Swartz at this

[virus-proof] email address: analog24@webtv.net (It is not generally realized that, because webtv has no hard drive, it is immune to destructive computer viruses.) Or, they may write to: Biofeedback Systems, Post Office Box 8501, La Crescenta, CA 91214. No telephone calls please. Depending upon the number of volunteers selected, applications will be accepted through the end of December 2000, with a possible extension through 31 January 2001. The duration of the study will be a minimum of two years.

I've had my AR8000 for about 4 years now. Earlier this year, I also
noticed missing segments on the display. It was the far left column of
"pixels" from the LCD display not showing up anymore.

So I did as you did, disassembled it and undid the LCD panel with the 4 bent
tabs, cleaned both the rubber contacts and the LCD panel with rubbing
alcohol and a swab, put it together and it works fine again.

Construction certainly could have been better.

659. Strange Devices on Street Lights (San Gabriel Valley in LA County)

Newsgroup: rec.radio.scanner
Date: 2000-10-12 00:00:00 UTC
From: Brian Andersen <brian@pipeline.com>
Message-ID: <0h82$hcF9Kla3@pipeline.com>
Source record: 77970
Cross-posted to: rec.radio.scanner,rec.radio.amateur.misc

In recent months, I've noticed peculiar boxes appearing on the necks of neighborhood street lights throughout the eastern cities in the San Gabriel Valley of Los Angeles County. All of the boxes are white and have antennas with coiled elements suspended from their undersides. They also appear to have coaxial cables running from their top sides to unobservable termination points along the necks of the light poles. They are not being installed on all the street lights, actually, but apparently on random poles--perhaps a couple of miles apart on any given street around the valley. All of the street lights they are suspended on, however, operate via traditional light sensor switches which turn them off in the mornings and on at night. So, I'm a bit puzzled over what purpose the new boxes are serving: they certainly aren't related to the control of the lights themselves. Has anyone else seen these, or know who owns them and what they're doing?

If it helps, I drew up a quick graphic in PhotoShop that shows what the boxes look like. See <http://www.snpp.com/staff/streetlight.gif>

They Started popping up in Santa Cruz in 1997 when ricochet started testing
the wireless 128kbs wireless modem network...they are wireless modem
receivers.

But......
The housings are pretty standard and can be used with other applications
and networks.

That's very possible. However, in this area, I do not believe the boxes
are serving any purpose related to cellular. For instance, one is located
about 50 yards south of my home, while 50 yards north of me is a macro cell
site. Certainly there would be no "hole" only 100 yards from a high-power
site to justify a microcell (etc.) installation. Also, the valley I live
in is 99% suburban and very flat. So with respect to all of these boxes
(in addition to the one planted on my street), I'd have to guess that they
aren't related to cellular services. There generally are no high buildings
or hills to block the macro sites.

Thanks for the reply, though. :-) The mystery continues...

That's an interesting possibility. Do you know of any web sites (somewhat like dslreports.com, but for wireless providers) that could give me a list of companies serving my area? I'd be interested in checking with them to see if any do in fact own the boxes I'm seeing in my area.

Many thanks for the response.

Yeah right - then why did you send me the e-mail with "9.00" as your only comment? I admit it isn't exactly cute, if fact its sort of infantile, but doesn't that cast a poor light on your claim above that you're not trying to be cute - just honest?

Note to hv's parents: Now you see that what they said about *not* spanking isn't true after all! A little discipline could have prevented this problem!

John, if you really are in the U.S. Naval Reserve, did you ever stop
to think that everything you write on here reflects, good or bad,
upon the USNR? You represent the U.S. military even when you're out
of uniform; that's something you can't detach yourself from. And if
you have any level of a security clearance, your comments on here are
surely being read and filed into some dossier, maybe even being placed
in your service jacket.

Be mindful of these things every time you begin to post an article
on a newsgroup; your U.S. Armed Forces ID card is in the wallet that
you sit on while you type your follow-ups.

According to the CI-V manual, the port for the IC-R7000 is 08H. If this
does not work you might try going through the setup menus. The port
addresses of the R8500 and the IC-746 are set in the setup menus.
The ports address are also listed in the manuals of the R8500 and
IC-746.

Hope this helps.

>Shack Unlimited. Which means you could not go into any RS store and get
>them.

You must only have franchise stores in your area. Here, I can go into
any RS store and special order a scanner crystal. In fact, I can even
order amateur radio transmit crystals if I provide the formula and circuit
parameters (crystal capacitance, type of oscillator circuit, etc).

>You had to order them. When you did, they would come from the Ft. Worth site.

That's what I said: "Special order." There are too many frequencies in
use for them to stock all crystals at their stores.

Maybe you should move to Hawaii so you can order crystals again.

I can see why you add: "x-no-archive: yes" to each of your articles...

Jeff,

I've wanted to say that for a long time, but never took the time. I'm sorry I didn't before, but I'll certainly second it now. Despite (or because of) my time in the Navy whenever I'm dealing with people who know I was in I always tend to hold myself to a higher standard of conduct. Guess I don't want to tarnish the memory of what others and I have done, and stood for. Even after being out for several years.

Well Said.

I believe you're right Tim. I haven't checked their prices lately because its pretty much a waste of time, but there is another Canadian retailer that may be good. (actually there may be a lot more). In my searches I've come across a place called Burnaby Radio in British Columbia - http://www.burnabyradio.com They seem to have reasonable prices: 799.00 CDN (I think that's less than 550.00 USD) for the Icom R-3 - cell enabled model. This is only an example, unfortunately they're out of stock on this model right now probably because those darn Americans are buying them all up :-)

Have a look - and NO I'm not affiliated in any way with them or anyone else, I just like to see everyone get the best deal out there and reward the dealers who give us those deals!

Tim
I don't disagree, the prices are sky high. I know people who that work
for radioworld.
Ever since the change over. the attitude has whole different meaning

Atlantic ham radio and Radio world merged to create one company. Rumor has
it the owner of
atlantic ham radio sold the company - was only dealer in canada to sale
brands like Yeasu i.e... other brands, company that wanted to sale Yaesu
i.e.. had to go through Atlantic ham radio.

Ps,. I still like the old atlantic ham radio. The prices, and friendly
customer service.

Mr Kelly, please forgive me but I have to talk to my boy. He's gettin' too far outta control here.

Now hv, you know what your pa and me have been saying about you and this 'internet' thing. You have to mind your manners or we'll have to talk about a possible 'time out'.

You know its not polite to tease others about their spelling. I always say if you can't say anything nice about someone - well just shut the hell up!

And what's this nine dollar business? I've told you that you need mommy's permission before you spend three weeks allowance on anything! Besides, I think these nice people are expecting more than 9.00 for their fine goods. If you need an increase in your allowance, we'll have to have that talk again. You know the one.....at age nine I should be able to expect you to do a few more things on your own. Most boys at age 9 can actually bath and dress themselves all on their own. I shouldn't have to spoon feed you anymore either. I could go on and on but I think you understand. If you want to continue to play here, you've got to start pulling your weight -- not that other thing.

Mommy's going to go now - I don't want to embarass you in front of your new friends.

xoxoxo
love mommy

I know absolutely nothing about scanning but have curiosity about aircraft scanning. I live in the boonies about 60 air miles from the nearest major controlled airport (Wichita). Aircraft approach paths do come over my home. Would an inexpensive scanner pickup air traffic at this distance?
Thanks,
Bob

P.S. I know that airports have approach and departure control radio traffic, but there must be "in-route" radio communication isn't there? It would seem that this kind of traffic would be long range. Anybody know how this works?

Bob,

The aircraft communication range is 118MHz-136MHz. Since you are 60
miles away from the airport, you probably will only hear the aircraft side
of the communications on the approach frequency. The same goes for center
(enroute) frequencies, unless you have an RCO (Remote Communications Outlet)
near your house. The range at which you will pick up an airplane is
generally the square root of its altitude. As for a decent scanner, look
on eBay and you'll probably get a very good deal. For something fairly
cheap, try Radio Shack's PRO-71 or PRO-75 (handhelds units). I have owned
both of them and they picked up the air band very well. Hope this helps.

I've seen them in a few places in Canyon Country, CA (northern Los Angeles county). I think they might be microcells or picocells. There is one spot in my neighborhood where my cell phone ALWAYS disconnected in the past, as I dropped into a hole (in a canyon, completely surrounded by very close hills), but the phone works fine in that spot now. The strange white box appeared in about the middle of that former dead zone, and not too long after it appeared, my phone started to work there. The antenna looks right for 800 Mhz cellular.

I'm cross posting to alt.cellular. Perhaps someone there might know.

FWIW - My phone service is on Verizon, which is 800 Mhz B side CDMA cellular.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2042 and PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published on the CARMA email list, carma@qth.net. You can obtain a free electronic subscription to the CARMA email list. For more info, see:

http://www.qth.net

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Most meetings are be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

You can query FCC databases directly from this web page: http://www.fcc.gov/searchtools.html

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Other frequency web sites include: |
http://w5gb.nmsu.edu/kc5kto/, |
http://www.fordyce.org/scanning/, and
http://www.scannerway.8m.com.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'.

(See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of

information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army

Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each

equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals

weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

Uniden sells refurbished scanners dn you can check current inventory at their web site:
http://www.uniden.com/docs/store

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120
Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the ICOM IC-R2, Uniden/Bearcat BC3000XLT, and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 2000 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229, email: electra@tcon.net,

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor

controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal
fundamental frequency. Merely supply International with
the exact receiver model number, printed on the rear label,
and the frequency you want to monitor. They will perform
the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second
local oscillator crystal is 11.155 MHz regardless of band.
On VHF high band (148 - 175 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700
series, one for each local oscillator. The crystal
formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the
first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

HAMFEST/COMPUTERFEST CALENDAR 2000 - ILLINOIS
last updated August 15, 2000

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, John Wass KA9QJX, Tom Harker, and ARRL for providing some of the information.

OCTOBER 2000

Oct 1 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Oct 8 (Sun): Cedarville, IL - Stephenson County Repeater Association amateur radio and computer hamfest. Jane Addams Community Center 430 W. Washington St., Cedarville IL. 8:00am-2:00pm. Admission $4.00. No advance ticket sales. Indoor table cost $9.00 for one, $5.00 per each additional. Tailgaters $4.00 same as admission, limited space available. Talk in 147.390. VE testing, times to be determined. For table reservations: coordinator Ruben Dowman KB9OLF (815) 563-9020, email: drads115@aol.com or Mel Welch (815) 563-4377 or Russ Love (815) 563-4921.

Oct 14 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Oct 15 (Sun): Orland Park, IL - Giant Computer Show & Sale (see below). Orland Park Civic Center, 147th St. & Lagrange Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Oct 22 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

NOVEMBER 2000

Nov 5 (Sun): Davenport, IA - Davenport Radio Club. Iowa National Guard Hanger, Mt. Joy Airport. Talk-in 146.88 MHz repeater. http://www.gwltd.com/hamfest

Nov 11 (Sat): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Nov 12 (Sun): Orland Park, IL - Giant Computer Show & Sale (see below). Orland Park Civic Center, 147th St. & Lagrange Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Nov 18 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Nov 18, 19 (Sat, Sun): Ft. Wayne, IN Fort Wayne Hamfest & Computer Expo. Allen County Amateur Radio Technical Society. 2000 Indiana ARRL State Convention. Allen County War Memorial Coliseum Exposition Center. Hours 9 AM - 4 PM EST Sat, 9 AM - 3 PM EST Sun. Admission $5 plus $2 parking. http://www.acarts.com

Nov 26 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

DECEMBER 2000

Dec 3 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Dec 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Dec 17 (Sun): Orland Park, IL - Giant Computer Show & Sale (see below). Orland Park Civic Center, 147th St. & Lagrange Rd. 9:30 AM - 3 PM. Adults $6, children $2.

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer
expo. The event is held on designated Saturdays from 9:30
AM to 3:00 PM. This show features computers, supplies,
games, parts, software, accessories, CD-ROM, monitors,
diskettes, printers, keyboards, modems, disk drives, cables,
expansion boards, services, etc. Lake County Fairgrounds,
Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall
Building #1=9720,000 sq. feet. For a show map, exhibitor
info, and discount coupon, visit the web site at
http://www.ccxpo.com.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is
Uniden/Bearcat 760XLT	R58 22K replace with 6.8K
	or other value.
	(select value for
	the particular radio.)
	Located on pin 14
	of MC3359P IC
Uniden/Bearcat 800XLT	R91 860K replace with 2.2M.
	Located on pin 14
	of MC3359P IC
Plectron P1	R81 180K may be ok as is
Plectron 700	R96 180K replace with 560K

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 2000 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://home.cfl.rr.com/scan/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the

squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are

cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise

burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a

tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly

compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents

4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage

to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are

backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test

unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR

scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be

programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image

rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The

Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per

channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date.

Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search.

No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. For a service manual, call SONY at (800)488-7669, and press 3. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you

find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes

FR2526 10 X X yes yes
FR2527 10 X X yes yes
FR2528 10 X X yes yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and

wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

This is the first time I have heard of someone being arrested for violating the ECPA (if that is indeed what happened here).

I think the biggest reason for not owning a cellular capable scanner has more to do with transmission modes than the legal issue. Much of the cell phone traffic where I live is digital and can't be monitored on an analog scanner. My guess is that in a few years all cell phones will be digital, which will mean that the cellular capable scanners which people are paying premium prices to obtain will be worthless for their intended purpose.

No, No, and No.
A Petty officer third class is on the bottom of the food chain - they only carry out orders given to them by their supervisors, Usually a 1st class or Chief and above. Third class petty officers are a danger to themselves and others due to their lack of experience. A "Real" Officer is a commissioned Officer (Commissioned by congress). These are usually people with Bachelor/Master degrees. I have never heard of a third class petty officer with a master's degree - why enlist when you can receive a commission and a higher payscale, along with responsibilities? I have heard of a couple of senior Chiefs (16 yrs +) receiving a master's degree, and a bunch of us earned bachelor's (took me 11 years of part time study) degrees.
-No he is just a lost soul with a serious personality disorder, and feels that he is powerful by sending flame mail. This is an Amateur Radio newsgroup, and this thread is definitely off topic.

It is interesting to note that control channel rotation is completely pointless. Some customers feel that if you rotate the control channel you will more evenly -wear- the transmitters. The reality is however that if you keep one transmitter on all the time, as in a control channel situation, it will actually outlast the voice channels. The reason being that the control channel will not suffer the thermal stresses of the other channels.

They must use them here in Connecticut too. I know of a site on top of a utility lattice tower. Two antennae, one pointing one way up the street, the other pointing the other. The Microcell cabinet (which looks like a miniature version of their full sized radio cabinet) is at the base of the pole. Good fill-in equipment.

Give Tom Ayers the prize. Those devices have been installed around the country by several PCS service providers. Just as Tom said, they are mini PCS cell site units. They provide local coverage for the troubled areas.

As time passes, and more companies get into the 3G upgrade, you will see more of these units all over the place. They cost much less than the big site boxes. As they are designed to cover just a small area, the ideal place to put them is on light fixtures and cable TV wiring.

Hey, the exact same boxes have started showing up on stop light poles throughout the county here (the east coast). I first noticed them about two months ago, but dismissed them as something to do with the stop lights - perhaps something to replace the in-pavement sensors commonly used to trigger the light changes.

That certainly did not explain the small antenna (which is slightly different then the one you show), but it was the only thing I could come up with at the time. Anyway, that idea does not make sense if they are also being placed on normal street lights.

Now I really do wonder what those things are.

Well, Mark, we certainly do not have any 128kbs wireless modem networks in this small county (heck, we don't even have full cable modem service yet), but those exact same boxes have started showing up here.

Bob:

I've listened to the VHF aircraft band since 1975 and listen primarily to ARTCC high altitude sectors above 24,000 feet. Even without outside antennas, you'd have no problem hearing airline flights & business jets 150+ miles away with good signal strength. There's also a few websites which allow a person to track the progress of airline flights while you're listening.

I just got into scanning and was wondering about all the mysterious channel sounds. e.g. There are some channels I get an electronic doorbell "ding-dong!" type sound and others I get a low kinda scary heavy engine type noise. What is this? Are there any sites or FAQ's that touch on this? My searches didn't turn up much.

They are secret mind-control devices. The top of the light pole contains a minature satellite receiving dish which picks up the mind control signal from government satellites, which goes down the cable to the local transmitter in the white box. Then the antennas transmit mind-control signals to people on the street.

I know it's true because I read it on the internet.

Actually, on a message board devoted to conspiracies I recently saw a few posts from people stating that the many cellular towers popping up everywhere are actually microwave mind-control transmitters. Guess the paranoid wackos haven't realized that everybody and their brother has a cell phone now... Go to any airport and you'll see hundereds of people yakking away on them.

Oh well, it's more fun to spread paranoia.

Thank you for your post. Have you noticed, however, that the ones who
get in trouble for scanning are those who publicize it. Funny, isn't it
that it is "illegal" to listen to something that is, at this very
minute,
invisibly passing through your house, your body, your brain.

If it passes through my body, its mine.

>It is completely amazing how Corky continues to post
>here year after year. Doesn't he have any friends anywhere?

Why don't we leave him be for now -- I believe we're going to see a drastic change in him. I've given him something very serious to think about: Does he want his posts to bring honor and pride to the U.S. Navy (of which he claims to belong), or or does he wish to continue to bring shame and embarrassment to that branch of our Armed Forces. He hasn't replied to anyone since I first posed this challenge to him.

Now, the County of Oahu (also known as the City and County of Honolulu) contracted with Ericcson for its new 900 MHz county-wide comm system, and has had nothing but trouble with it. I'd like to know what cities/counties have dumped their Ericcson systems and gone back to their original equipment. It's too late for Oahu -- the old (but reliable) 150 MHz Motorola system has been removed.

(Note that the new system was turned over to the county in 1999, then Ericcson has the gall to ask for an additional $700K to make the system Y2K compatible!)

Uniden Bearcat BC60XLT-1 30 Ch Programmable
Ebay Item# 461087122
Auction ends in 25 hrs. (Fri. Oct-13-00 20:25:30 PDT)
Currently only $30.00
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=461087122

Features:

30 Channels
Chain Searching
Priority Channel Scanning
Manual Channel Access
Memory Backup
Weather Scan function
Preset Two-second Delay (end of transmission)
LCD Back Light

supports the following frequency ranges (in Mhz):

29.0-29.7 10 Meter Amateur Band
29.7-50.0 VHF Low Band
50.0-54.0 6 Meter Amateru Band
137-144 Military Land mobile
144-148 2 Meter Amateur Band
148-174 VHF High Band
406-420 Federal Govt. Land Mobile
420-450 70 cm Amateur Band
450-470 UHF Standard Band
470-512 UHF "T" Band
Itemized list of contents:

Uniden Bearcat Scanner Radio unit
Detachable Antenna
AC Power adaptor
Operators Manual
Betty Bearcat Starters Frequency Guide

For the best peformance on the public safety bands, would most of you agree that the RS20-014 antenna is one of the top antennas? I currently have a scantenna and its performance seems to have diminshed due to its flimsy construction. Thinking about trying to find a 20-014. Any other recommendations?
Thanks

What is the point of posting that an ongoing auction is $xx.xx?
I fail to understand this. If it was $9 why post that info if there are
obviously days left before the auction is over. Plus most people are going
to read $9 then immediately go to the auction and see that it is $175, this
is stupid. If you start the auction at 9 bucks or 2 cents doesn't matter.
All that matters is what the price is at the end. Please stop.

This whole mess embarrasses me. I really hope Rich is not reading it. Why is it usenet has to have so many negative posts? In all the different groups I am a regular in, there they are. Rich spends much of his valuable time when he could be couching with his wife, working on his site, and all for free, while lots of guys are slinging mud. If I was Rich and read this crap, I would be inclined to spend less time on the site, and say the hell with those negative @#$#$$%! It is a real site with all the bells and whistles, bulletin boards, newbie education, the works! Not just a 10 page newsmag or a revolving never updated post to this newsgroup!

Buy one it'works really well,the Icom software works well & is easy to use.On HF it's best to switch in the attenuator to stop over load.A preamp is not needed on Vhf/Uhf the rx is good without.Yes it can cover Cellular !! with the right software just change the country code.BUT you must NOT listen to these frequencies of course.

740. Multi-Antenna Hook Up to One Scanner???

Newsgroup: rec.radio.scanner
Date: 2000-10-14 00:00:00 UTC
From: swardfoto@aol.com
Message-ID: <20001014190757.03102.00002460@ng-fh1.aol.com>
Source record: 77750

I would like to know if anyone has two antennas hooked up to the same scanner so that both antenna signals are received at the same time?

I scan aero freqs so I would like to use a discone for omni-directional coverage and a directional antenna to pick up the local airport that I currently can't receive (in other words, I'm only receiving half of the comms).

Can a splitter be used "in reverse" or is there a special unit made for this?

Any feedback is appreciated,

sward

True, but to insure that different agencies can talk to each other,
they will eventually have to agree on a standard encryption method. And
as soon as they do that, you will see devices, and even scanners
themselves, flooding onto the market to defeat that encryption.

I'm not sure suing under FOIA would get anywhere. Most of the
FOIA or Sunshine laws I've seen allow the public agency some
period of time before responding to the request (3 days, 5 days, etc.).
You might be able to get copies of radio logs or radio log tapes
(that'd you'd have to pay for) but I don't think you could successfully
sue to hear the actual transmissions real time.

Nope, Mark, right now I live on the East coast, way out in the country
in a small southern county (hey, I'm just visiting). And there is
certainly nothing like 128kbs wireless modem networks around here.
Heck, we don't even have reliable internet connections by telephone
(though the phone/cable company promises that we'll have cable modems
one day).

I tried this as an expiriament once and found that with one scanner hooked up
to two separate antennas at the same time, a splitter really isn't needed.

> know personally. With Motorola HT's, and with great sucess.

They were not Astro...
The border patrol is useing Astro...no encryption.

As far as the feds use of des goes...
The '84 Olympics(L.A) was the big test for DES. I thought it was funny when almost all the fed stuff was DES on day one....by day 2 and 3 everything was in the clear. Reduced range...dropped keycodes during diaper changes.

Today...16 years later...most of the fed stuff in socal is in the clear...oh it's a little better now some repeaters were added. Even with OTAR the radios are still buggy.

Can't wait for Seneca to take root...gulp!

Mark

If you read this permit it is a Shortwave Radio permit that allows having a
radio able to receive police frequencies in a vehicle. That should help all you
doubters.

;)

I guess you simply do not see the inherent evil in such laws. This is too bad. Every despotic government on earth seeks to control what the people can see, hear, and talk about. Secret police agencies all over the world kill and imprison people every day on the basis of this kind of law.

The law is basically censorship, in a nutshell. What is it that the police want so desperately to hide ? Their own internal misconduct ? This kind of law should not even exist in a country where the government, for years and years, spent millions of dollars running the Voice Of America stations, broadcasting the truth to millions of those trapped behind the iron curtain, having to use millions of watts to break through the Soviet jamming of those transmissions. It is sad to watch these erosions of liberty, after thousands upon thousands have died in wars to preserve them. The government currently spies on people`s telephone calls, millions every day, whle denying you, the law-abiding citizen, the right to listen to your little local "bubble": of public safety agencies. In the meantime, they "suck up" to every draconian, despotic, nazified government they can find, like the Chinese, who kill people for even stating that they want democracy. Soon the FBI will be given the right to even spy on your e-mail, using Carnivore. (Not that the NSA isn`t already doing it).

And you come on here, touting the "inherent goodness" of a law that embodies Soviet Russia in her heyday, when having a reciever in your posession that recieved "unauthorized frequencies" was cause for you being dragged away in the middle of the night, and being beaten, shot, or maybe shipped away to prison, all without the State having to answer for it in any way.....

Whoa, Zombie. Keith was only clearing up some misconceptions in an earlier thread. In fact, based on what he said in that earlier thread, I'm sure that he fully shares some of your concerns about these types of laws. In other words, his intent was not to defend the law, but to correct some of the statements he made in that earlier thread.

> What is it that the police want so
> desperately to hide? [snip]

And, I also agree with your concerns. It does seem to go against the very nature of this country's ideals for our police to attempt to conduct their business in secret.

While I don't agree with the law I don't believe I am in living a Nazi state
that is denying my rights. The law is simple and straight forward and it does
allow anyone to obtain permission to use a radio receiver in their vehicle with
a permit. In some states and cities you can't even do that.

The only thing I will say about that is when digital encryption is the standard
it will be impossible to monitor many transmissions over radio. The solution
for anyone wanting privacy over radio is encryption and many police agencies
are preparing to move there.

Generally the business radios that stores would use has a very limited
distance. If you're gonna sit in the parking lot to listen, you'll probably
see them doing it before you hear anything on the scanner - stay out of
sight so they don't come at you :^)

They need to get the basic digital part working first. Astro sounds bad enough by itself...
Does anybody including the feds actually *use* encrypted astro with any success?

This law establishes a discretionary permit to use a scanner. They can deny your application for any reason, and you have no recourse.

The BC 780 XLT got final FCC approval back in April 2000.

You need to read the 4phun-radio@eGroups.com list to be up to date on the BC 780XLT.

There are also specific email lists devoted to the BC780XLT at EGroups.com 4phun-radio@eGroups.com only mentions it in passing among many other topics. You could browse the last two weeks of messages at 4phun-radio to find a bunch more information on the BC 780XLT by visiting http://www.onelist.com/messages/4phun-radio with a browser and going back about eighty messages or so.

Another source of BC780XLT information is to vist the web site www.strongsignals.net every week .

BTW most will not see one until after the begining of the new year.
The final tweaks were just finished just a week ago.

I've noticed that McDonald's drive through frequency of 35.02 can usually be
heard quite a distance away, like maybe about 1/4 mile. The headsets that
operate on 154.600 have a much shorter range.

Well the law allows the MSP to issue permits, now. According to a guy named
Mark that posts on Strongsignals.net hundreds of permits have been issued.
One way to apply for a permit is have wide band radio with SW and apply for a
permit to listen to Shortwave radio broadcasts in SSB. If they deny you a
permit you have what is called legal standing, then you can take up your
complaint with the FCC and then the federal courts. Or you can state you want
to listen to Ham Radio stations in the VHF and UHF bands. The important thing
is to have a legal standing, it is legal by federal law to listen to a ham
radio station anytime, anywhere and divulge all contents. The lawyer I talked
to said a person that uses a SW SSB radio in a car and is denied a permit would
have legal standing because there are frequencies intended for public reception
near 2.4 MHz.
God help the citizens of Michigan if the police are assigned frequencies in
the MW or FM band! ;)
The key to defeating the law is through the federal courts and not the
Michigan courts.
What is needed is a person to be denied a permit for legitimate purposes and a
pro bono lawyer or a civil rights organization to take the case up with the FCC
and then the federal courts.

I am looking for an original owners manual for an Icom IC-R100
Communications Receiver. I have a good copy but would like to have the
factory original. Please E-mail me if you have one you would be willing
to sell.

Hi,
Today we launch our WAP site. www.frequencyuk.co.uk/wap/index.wml
This is in time for the Network Q Rally of Great Britain were we intend to list frequencies in the normal way on the internet and also on the WAP site. People will able to use there WAP handsets (normally a mobile phone) to access frequencies while they are out and about on the rally itself, ending the problem of getting frequencies to people while they cannot access the internet in the normal way, especially when they may be away for a 4 day event like this. They will also be able to use their handset to send us frequencies that they find while they are on stage so we can instantly update our site and inform as many people as possible of frequencies being used.
For a demonstration if you do not have a wap enabled device visit our main web site www.frequencyuk.co.uk and on the left frame of our main page click WAP details, at the bottom of this page there is a button to take you to a WAP emulator. This shows the site as seen on a mobile phone. (it does not show perfectly due to the scripting differences between the internet and WAP)

We are running it as a trial and if all goes well we shall work towards supplying airshow and event frequencies next year through this system. The mobile internet is small at present but it is growing and we are sure by the time we reach the airshows season in full next year it will be the perfect format to keep people informed of frequencies.

I am looking for feedback on this idea and your thoughts are as always welcome.
Tristan

You have an absurd idea of what "better" means.

The best scanner law is merely to ban use of a scanner "to intentionally and directly further commission of a crime." Michigan requires that one obtain official permission from someone who A), may have something to hide, and B), cannot be held responsible for refusal to issue the permission.

I'm looking forward to someone stepping up and suing a state with a scanner ban on FOIA violation. ;)

Welcome to fascism under the guise of constitutionality. Every wonder why
outlawing alcohol required an amendment but outlawing marijuana didn't?
It's exactly as implemented above. It's been ruled constitutional as long
as a permit is theoretically available. That a permit is impossible to
obtain doesn't seem to matter to the courts.

Richard...

I bought the 8500 back in March..at the time I had the
feeling that I had gone overboard in a casual hobby.
However, after a few weeks of familiarization with the
receiver, I came to the following general conclusions:

1. It is an inherently quiet receiver. Having used the old
Kenwood R-5000, the Icom 7100 etc...and still have
the computer controlled PCR-1000 set up also...and
many centuries ago, the old Hallicrafters receivers.

This quietness is a fundamental quality of the receiver.

2. The HF bands are superior to any receivers I have used..
..mind you I haven't used the top-of-the-line JRC radios.
I'm using the Alpha Delta 60 ft SW Sloper...the receiver
seems to do quite well with this antenna.
Amateur SSB does exceptionally well...I've rediscovered
the 40meter band...even with the horrible conditions
(heavy sunspot activity during the spring/summer I
still found it able to pull things out of the trash.
3. Seems absolutely stable...from start up to perhaps 3
hours later..it can hang in there on a frequency...warm
up does not seem to affect its stability. SSB signals do
not drift around...period.

4. On the frequencies above 30mhz, I use an attic mounted
omni directional antenna. Everything is currently being
driven by RG-8U...The Police 150mhz area is stable
as is the 800mhz band. I rarely tune above the 900mhz
band...I'm near a large Metro area and these areas are
rich with radio energy!

As is surmized by the above comments, my listening habits
are probably basically the same as most SWL types. I do, on
occasions, tune the Commercial Shortwave bands...needless
to say the 8500 is outstanding there. I route the audio to
a Pioneer receiver that I use as an elaborate switch to alternate
the audio between my PC and the 8500...the Pioneer receiver
drives a pair of Paradigm Titan speakers..even though they
are "full range" speakers, they do exceptionally well on
communications...they make heavy static conditions more
acceptible and oddly enough, if you're listening to a "foodfight"
on the 20 meter band for rare DX it is more intelligible via

the Paradigms than a powered communications speaker with limited response! Anyway, the audio quality out of the 8500 is a cut above average. This out of a communications receiver!

On the 75meter band, I hear a series of QSO's that start fairly early, say around 4:00pm EST, when the band is still basically "out". This group of Hams are located fairly close to each other..I'm further away from them than any of the group talking to each other... with the 8500, even when conditions are bad, I can still pull them out...not so on the PCR-1000...part of the issue here is that all PC's generate power-supply noise, sound card chatter and general board noise unless you have some of the better Abit, Asus type boards. I've spent a lot of time trying to quiet down PC's (I build my own...assemble is a better word) If you can...listen with the PC off! Particularly the Monitor!! PC's are full of RF trash, radiation.

In general, the 8500 is a quiet, smooth, quality built receiver, built like a tank, heavy, somewhat large and does a creditable job over a wide spectrum... ..it is probably more receiver than I need in a casual hobby...but, what the heck, you only live once...maybe! I keep thinking I should have bought the Icom R75, I tried out one for a couple of days...it did exceptionally well on my antenna. I'm curious as to what the dislikes on the R75 have been!

BTW, the 8500 is approved for SETI use, with a mod to remove the slight AGC (AVC) built in as a default.. of which you can hear it pumping...particularly with the noise suppression on! You can't cut it out completely without the SETI mod. SETI requires a basically quiet receiver and virtually perfect stability. The 8500 has that. Its 9000 heritage is showing through! The 9000 series has been dropped..it was basically for Govermental uses anyway.

As a passing comment, the AGC pumping can throw you off and make you think this is a noisy receiver...for example, if you're tuned to a frequency with no signal, this auto AGC/ RF circuit will pull you right down into the atmospheric noise that is there...seemingly a characteristic of extremely hot receivers that have inherently low noise circuitry. Also, the noise has different characteristics than from a standard receiver...ever so slightly.

Good listening...

Leonard..

P.S. As to the worth, regarding the price tag...probably each
person has to arrive at that conclusion. You are facing the
same questions I had prior to my purchase. I have an
old RS 2035 scanner that does a decent job.

Naw, it just means a new generation of scanners will soon begin to arrive, and another column in the scanner lists for digital setting.

Under Federal law, ALL information on frequencies and tones (which includes APCO settings) are public information, whether you are on FCC or NTIA coordination. The only way for an agency to get around this is to use the little "transient" trick (that is, public safety agencies are permitted to temporarily use unused frequencies without reporting to the Feds). I know of one agency whose detectives simply reprogram their (120-channel) Saber IIIs at the beginning of each week -- the reprogram takes seconds, and they have about 50 back-channel freqs, which they rotate by the shift. When a freq goes into use by some company or other, they simply drop it from the programming and grab another.

As they move into Astro Sabers, they get APCO and they also get narrower bandwidths.

You need to understand the Michigan mindset. While most of the state is composed of small counties (and smaller towns), the real power is in the "Thumb Area," Detroit, Flint and so on. Detroit PD and the MSP swing a big club with the state government (would you believe that it is unlawful to paint your car certain shades of blue?).

Another oddity: I now live in Utah. If I want to, I can get, say, an Indiana concealed-weapons permit, and on the basis of that permit carry a pistol in Michigan. If I lived in Michigan, that same permit would NOT let me carry that same pistol, simply because of residency.

Fortunately, the majority of LEOs in the "Big, Flat Hand" are in the rural areas, and don't trust the state or the Thumb Area cops many more than the non-cops do, and so they tend to be very copacetic. One MSP trooper told a friend of mine (whose driver's license and insurance had expired while she was out of the state) "You want to stay away from Detroit until you get those taken care of!"

No.

It allows anyone to REQUEST permission. There is no requirement that
such permission be granted to ANYONE.

You are too close to the problem to see it.

Digital encryption you can not monitor unless you have the algorithm to
decipher it, digital modulation is entirely different. Have you decrypted any
military encrypted communications lately? I thought so.

When my kids were about 8 to 10 years old, they thought it was realy
cool to sit in MacDonalds and listen to the pickup window. The simple
pleasures.

How many PO3's do you think might have died on the COLE yesterday?
Would you like to send along your opinions to their families right
now? Maybe it was really a PO3 who caused the explosion, since they
are such a danger to themselves and lack experience.

I guess you realize your attack on one individual was ill-timed, and
and therefore became unnecessary attempt to smear a whole class of the
US Armed Forces.

The first post was correct. The Ricochet mobile system IS the user of the boxes. Not only do they provide a "WAP" (Wired Access point) for laptops..but are also used for remote meter reading by the local power company. The meters "talk" to the box on carrier current and retransmit on the 902-928Mhz band in Spread Spectrum mode. The new boxes are 128K boxes..much faster than the first generation.

I am pretty sure the previous poster who suggested they were for
Mobile data communications (Ricochet) is correct. They are also
turning up in my neighborhood in Phoenix, every few blocks. They were
not there a few weeks ago. As it is a residential neighborhood, I
have a hard time believing it would pay to put that many microcells in
residential area. A check at the Ricochet web site reveals I am in
fact in a Coverage area currently being built out.

The antenna is to long for 800Mhz. My gut feel is that it is something
in the 400-500Mhz range. It is white box mounted underneath a street

light with the antenna pointing toward the ground.

Ricochet's web site confirms that they are indeed mounting radio transceivers on light poles and utility poles...

I just got a scanner. Nothing fancy, but it suits my needs. Our business has had trouble with a gang of teens vandalizing and breaking in. We wanted to listen at home to see if the cops saw anything there. Anyway, while searching the net for those freq's, which I found, I saw freq's for FF, Stores, phones, etc. I'm just wondering what the range is on picking up those kind of freq.? Do you have to be in the parking lot, or could I receive it from some distance? And how much of a distance? Sorry for the stupid question.

The only sure way to find out what these are is to sample the 'goods' going
into them using a frequency counter and see what comes up.

805. Michigan Bill 6012 & 750.508 Clarification

Ok, I called my lawyer and faxed him the law and the law excludes the following classes of persons:
People with a permit
Hams
Police Officers.

The tricky part is the "Does not apply to" in the beginning.
(I think a lot of ham and scanner owners missed this.)

Also since the law defines "radio receiving set" it excludes transceivers that are licensed by the FCC, which the FCC through federal law regulates and no state can regulate without permission. (The current proposal for CB's would allow states to regulate CB users.)

So this new law is nothing new, but a clarification of the old law. I apologize for my transgression. If anyone in Michigan places a "radio receiving set" that includes coverage of frequencies assigned by the FCC for police purposes you must simply apply for a permit, if you are not a Ham or LEO. If you have a criminal record in Michigan you will not be able to get a permit for your vehicle.

I jumped on the anti-scanner band wagon without looking and I realize the Michigan law is better then other states. So just apply for a permit and you will be able to have a radio receiver set in your vehicle. Law-abiding citizens are protected by this law, criminals are not and local jurisdictions can not override a state permit or law by passing some no scanner in car law.

This law also clarifies the scanner in a vehicle, so if you buy a scanner and put it in a locked trunk you will not be in violation of the law. Having it installed or in your possession without the three exceptions you are breaking the law.

SWL's with SSB reception of 2.4 MHZ MUST have a permit for their radios if it is in a vehicle, because those frequencies are assigned by the FCC for police purposes. I know it is weird, but remember you have a "radio receiving set". (Yes, I ran this by my lawyer and he stated yes because the frequencies are assigned by the FCC for police purposes. It doesn't matter if it is 2.4 or 460 MHz the law is the same.)

Also hams with transceivers need not worry about this law, if a cop asks just tell him it is a FCC certified transceiver and show the cop your ham license.

I know that most scanner owners want no regulation, but this law has been on the books since 1933 and was upheld in a 1982 court case.

To help you out with the application process:

Reasons for permit:
Race car radio monitoring fan
Weather watcher for listening to ham radio skywarn and/or national weather service broadcast.
Monitoring Fire departments.
Shortwave Radio broadcasting monitoring in single-side band mode. (for you SWL's)
Marine radio monitoring.
Train Monitoring.
Ham Radio Monitoring.

besides the police monitoring reason. ;)

One more thing, this law applies to all "vehicles" not just cars, so
any one with a radio receiving set able to receive police frequencies
in their vehicle must have a permit to install or have that radio in your
possession while in a vehicle. Once again transceivers under federal
jurisdiction are not subject to this law.

Hi Keith,

What you have written is informative. However, I have a concern. I am originally from Michigan and became a ham because of this law.

In 1978, I applied for a permit so that I could listen to police calls in my motor vehicle. I had NO ARREST RECORD and had NEVER been detained or even questioned by the police. I was rejected by EVERY department I applied with including the Michigan State Police and the Detroit Police Department. I was told that there was no REASON why I was REQUIRED to have a permit. They also stated that I had no REASON to listen while in a motor vehicle.

I contacted several police chiefs in Michigan and all stated they would not deviate from the longstanding practice of the MSP to use a blanket policy to deny ALL requests.

Perhaps things have changed. However, with the mind-set of some police executives, I doubt it.

I became a ham and later a reserve police officer in Detroit because I wanted to be able to listen and I enjoyed doing so without restriction.

I agree with the spirit of your message. However, I am NOT convinced that it will be as easy as you suggest to obtain a permit. I hope you are correct.

Finally, the movement to the APCO 25 digital format, combined with encryption, MAY eliminate some of the LEO concerns about monitoring.

My Bearcat BC 890 XLT has finally died after 7 years, so I'm looking for a new scanner. What I want is a fairly basic model in the under $100 - $150 price range, with at least 25 channels, and one which can pick up the 43 to 48 MHz cordless phone channels (or are those now blocked, I know that my bearcat had the cell phone freqs blocked?). I'd prefer a base station type, or a portable that uses rechargeable batteries. Thanks in advance for any recommendations

Duh,

Thanks for your expert insight.

I know they don't MAKE them, but THEIR NAME is on them. RADIO SHACK
should take some pride in making sure the items they have THEIR NAME
on work well prior to release.

Man, it aint easy here.

SHEEESH

This is the silliest logic I've ever seen...

FORD doesn't manufature the tires that are causing their beloved
Explorers to roll over and kill people, but they are sure taking a
HECK of a beating because of it.

Would it then be alright to say that Radio Shack could sell any piece
of crap scanner made XYZ company, and survuve by saying, well, it's
not our fault, we don't make them, we just sell them...

They wouldn't be selling many more scanners now, would they?

Dan

Uh, doesn't matter. Unless you do your sampling somewhere inside the
circuit, hanging a frequency counter (actually a spectrum analyzer)
around the outside only shows you what's being received around the
outside...DC to light. You can't draw much information from that. But
some internet paranoid will try.

So an aircraft radio using separate receiver and transmitter (the old Collins VHF did) would still require registration with Michigan if the aircraft were to enter the state.

Cool. I can't imagine the FAA going along with that one.

The police ARE assigned frequencies in the UHF television band. So anyone wishing to carry (not necessarily to use) a portable TV receiver in a vehicle's passenger compartment, should also apply for a permit. When the entire MSP is involved processing permissions, perhaps someone in Detroit will come to his senses.

Please forgive me for this extremely stupid question, but I have never worked a scanner before. I think I am the only one who can't understand this.

Does a scanner work the same way as a regular radio in the sense that you can go directly from frequency to frequency? I ask this because someone once told me that once you reach a certain capacity with your scanner, that's that. I wish I could explain my confusion better, but I'm too...well, confused. LOL

Any information would be greatly appreciated.

Sue

Most scanners have two ways of operating - scanning and searching.

Searching is a lot like moving through the dial on a radio - you might have to enter limits (ie 450.000 to 460.000) to get it to do it, but it should then move up (or down - some do both) through the frequencies, stopping on any transmissions it finds.

Scanning is where you enter specific frequencies into memory and then it scans through all of your saved frequencies looking for transmissions. The number of frequencies you can store is limited - it varies from one model to the next. The first scanners could only store a dozen or so - the latest scanners might hold up to 1000. Most scanners allows you to manage which stored frequencies to scan by grouping them into 'banks' of 10 or 20 (for example) that you can toggle on and off. You could fill all those memory slots and not be able to add any more. But you could always go back and replace frequencies you don't care about anymore and put new ones in their place.

Hope this starts you off in the right direction
-A

Yea Blake...
The cops in San Jose CA. just call the criminals and ask them to "come down and surrender". Since most of the criminal don't own their own cars...the cops reimburse the $1.25 busfare. Since the transit agency wont allow more than 2 automatic weapons and 6 kilos per rider. So the cops have to send cabs to some houses. The cabbies make out pretty well. When the cops hold the news conferences...the suspects also answer all questions from reporters. There is even free food.
If the cops actually have to GO to a badguy's house...they knock...wait...and say "freeze" just like on TV.

Our speed limit is 25mph and gas is 49cents a gallon.

Well, I guess I could. Anybody out there know why an 890XLT would have a problem with the squelch? The problem is that even when I turn the squelch all the way to the left (to it's least sensitive position), there is still "white noise" that isn't blanked out, so pushing the SCAN button will only take it to the next frequency before it stops. For a time, making adjustments to a variable inductor (L18) on the board would make a difference for a while, but now it's to the point where the slug in the inductor is screwed all the way in and I can adjust it no further. Adjusting the "SQ" potentiometer also helped for a while, but it now has no effect.

Actually, no, they like big, flashy ninja raids.

However, the average dope dealer only shoots other dope dealers. He knows that A), shooting at the cops is a good way to get dead, and B), a good lawyer will get them out of the bind, or at least with only a little jail time, where they will be second in the pecking order only to murderers, during the three or four years that they will actually spend in prison.

Don't believe me? Go interview a couple of hundred cops, like I have in my news career.

The hardest stories to get any details on are where a group of thugs imitate the dope cops (ninja suits and all) to pull their own raids on rivals. In one Midwestern city, they wear the exact same brand and model body armor that the dope cops wear, carry the same weapons, and even have the radios, rams, and other items. They break down doors screaming "DEA! POLICE!" Everyone cooperates during that vital first minute, and the neighbors all vanish, rather than calling the real cops. After everyone inside is under control at gunpoint, they are robbed, sometimes raped, and the fake ninjas are gone again in a matter

of minutes.

It is possible that these thugs have been caught, but they hit half a dozen times that I know of in 1998 alone.

You want to approach reality? That's where I work, day in and day out.

Actually, I should have clarified my posting: I suspect that the
devices in question are actually transceivers rather than receivers, so
if discrete frequencies were used, it might be possible to sample their
radiated signals. On the other hand, spread-spectrum transmissions
would not reveal much on a frequency counter...

It is part of the Ricochet 128Kbs wireless data network. The antenna that
is pointing down is for 902 to 928 MHz spread spectrum communication to
wireless modems. Check the Metricom and Ricochet web sites.

> name a few.....

As I've already said, all this was done, without radio encryption, for the first sixty years, or so, of law enforcement's use of radio, so why it is suddenly a big secret now?

Since our taxes pay their salaries, the police are supposed to be working for us, the residents of the community. Therefore, we should know what our employees are doing when they excute a search warrant on a drug dealers house, or conduct surveillance in criminal investigations.

With the removal of the public's ability to listen to police radio broadcasts, we lose yet another means to observe, learn, and critique, what the police are doing. And, with the loss of that oversight, we lose a tiny bit more of what little means we have to control their behavior.

And, if we (the public) lose our control over the police, then who will control them? And can we trust that whoever does control will use that power in a manner that serves the public's best interests? History has given us a clear answer to that question, Andy.

832. ScannerWear - registration help

Newsgroup: rec.radio.scanner
Date: 2000-10-15 00:00:00 UTC
From: Sir Nigel Puke-Fooey <wanker@myrealbox.com>
Message-ID: <39EA5D3A.55105835@myrealbox.com>
Source record: 77671

I recently downloaded, from some obscure source, a demo version of ScannerWear 2.5 to control my elderly R7100 receiver via my elderly Windows 3.1 computer. ScannerWear worked just fine, although parts of it were crippled. So, credit card in hand, I phoned the 800 number to register it. But the 800 number no longer works - no wonder since the copyright date on the program is 1994. I also did an internet search on "ScannerWear" and got only a few hits, none of which were links to the company. Perhaps it no longer exists.

I would still like to un-cripple Scannerwear 2.5, either by registration or by other means if registration is no longer possible. Does anyone out there have a working version of ScannerWear 2.5, or registration information, or information on who if anyone now owns the rights to ScannerWear? It seems that if the owner of a program no longer exists, then there should be no problem using a copy obtained by any means, especially given that the last version of it was six years ago.

Can anyone help? Please send replies to wanker@myrealbox.com. Thank you... Nigel.

Forget the modem and cable, Mark. Send me a plane ticket back to
civilization instead!!

No, actually, after living in the Seattle area for a few months (and a
crowded city in Italy before that), there really is something to be said
for the country life. It is less stressful, more laid back, and more
confortable, here. And the people seem calmer, less aggressive. I'm
going to miss all this when I do head back to the city life in a few months.

I just got my Police Call 2001 in paper format, in the mail today.

I'm a little disappointed though, Volumes 3&4 have been combined and now
the book is an inch thick, compared to Volume 3 usually being about 1/2
inch.
Not as easy to tote around now.

And if they were to add any states, I wish it would have been Missouri...

Just go to www.policecall.com and order....

I will make the assumption here that you are speaking of the US Navy.

23skidoo <23skiddoo@house.com> wrote
> A Petty officer third class is on the bottom of the food chain - they only
> carry out orders given to them by their supervisors, Usually a 1st class
or
> Chief and above.

Wrong! ALL Petty Officers have to attend "Leadership Training" because they
lead
the Non-NCO enlisted (E-1, E-2, E-3)

> Third class petty officers are a danger to themselves and
> others due to their lack of experience.

This above statement clearly shows you have little or no knowledge of
the military or navy. Petty Officers (of any class) are often the MOST
experienced in their jobs because they have the most recent
hands on experience.

> A "Real" Officer is a commissioned
> Officer (Commissioned by congress).

Wrong again, the commission is signed by the Commander in Chief, NOT
the "congress" as you state!

> Bachelor/Master degrees. I have never heard of a third class petty officer
> with a master's degree - why enlist when you can receive a commission and
a
> higher payscale, along with responsibilities?

Once again, the above statement clearly shows you have little or no
knowledge of
the military or navy. In order to receive a commission without the Academy
or
ROTC, you need to start out enlisted & then start applying for a commission
when
you reach E-6.

I haven't been on this NG 6-7 years, not even 5 year. Once again, you
are a fool who knows NOTHING of what you are speaking about.

> Well, looks like I should come back in another two years.

Please, make it about 10 or 20 years.

SNIP

> Who was Bill Cheek?

This question is often asked, here is the standard response below.

Bill Cheek was a man who lived near San Diego. He used to be active on
Fidonet but then had
to leave due to reasons we won't speak of now. He then became active on
this NG & the
internet but was again involved in much trouble. Various problems with Mr.
Cheek's action's
resulted in Peter Laws kicking him off of the "Scan-L" mailing list. More
similar problems with
Mr. Cheek caused him to have his internet access revoked by his Cable
company

ISP in summer 1998. In 1999 he was briefly held by (federal) authorities and was
been charged in (federal) courts with various illegal actions in regards sales for the use
of scanners. (He admitted to other legal problems in the past, also) He was the owner
& operator of a company called "Comtronics" & has produced a few books based on
information he had complied from various sources.

Despite various rumors, Mr. Cheek did NOT have any FCC issues licenses within
the last 15 years.

Mr. Cheek claimed to have been in the Army, others said he had been in Navy. His
rank or billet is unknown.

Mr. Cheek was well known by many for various reasons in the radio community. Some
people feel his technical knowledge was notable, some people feel certain aspects of his
personality were notable.

Due to mounting legal problems followed by health problems, in 1999 a donation request was
made to the general public to assist Mr. Cheek who had no health insurance. His legal issues
were being addressed by a public defender.

Mr. Cheek was a smoker and died in July 2000 due to complications of Lung and Brain Cancer.

He is survived by his wife Cindy and his children.

Another one is:

www.thetrip.com

I'm not sure about ww.flytecomm.com, but the last time I checked,
www.thetrip.com would only allow you to track one flt at a time.

There is software available that allows you to track as many flts as you would like (however, there is usually a subscription fee). We use Flight Explorer at work to track multiple flights (as many as you program it to track). It tracks flts anywhere in the US, Canada, North Atlantic and North Pacific.

I know there are others out there, but Flight Explorer is outstanding for tracking.

Good luck,
sward

I have for sale a Regency Model HX2200 AM/FM Handheld Scanner.
The unit is 20 channels programmable.
Frequency range: 118-136 mhz (Air Band)
138-174 mhz (VHF HI)
406-490 mhz (UHF)
490-512 mhz (UHF "T")
800-950 mhz (No Blockage)

I bought the unit new years ago and have never had any problems with it.
I will include the original box, instructions, AC adapter and a leather case.
My price = $125.00
I will pay shipping to any US address.
I can email pictures if you like.

I've been hearing the engine noises for years. It could be the sound of just
that an engine somewhere in the surrounding area.
If I could hear the sounds of hospital equipment where I lived previously, then
anything is possible. Recently, there was people working near my home with
Jack-hammers, I could hear them on my scanner and my CB.

All kinds. But RS doesn't manufacture any of them. They're either built by GRE or Uniden an have an RS name tag slapped on them.

Nope. But then, they shouldn't be giving that name over the radio.

> How about a execution of a drug search warrant on a dealers house??

This actually SHOULD be broadcast -- the dope dealers have scanners, and
if they know that the masked ninjas breaking through the door are the
cops (rather than rival dope dealers), they will be able to give up
peacefully. With dopers and other crooks doing "doorbreaker raids"
dressed up as ninjas -- just like the dope cops -- there is a lot of
danger in them.

Of course, the cops COULD act like AMERICAN police, not Stazi, and this
would solve the problem, but this is too simple a solution to appeal to
the idiots pinned to the backs of some badges out there.

> How about surveillance in criminal investigations??? Thats just to name a
> few.....

If you think that surveillance is conducted "in secret," or that
legitimate stake-outs involve a lot of radio traffic, you've been

spending too much time in front of the TV.

>The 9000 series has been dropped..

No not true the R-9000L is still being produced, retails for
$ 9,999.00.

Only sold in the United States to wireline and government customers as
it has never had the cellular phone frequencies or image frequencies
removed from it.

Remember as of October 25, 1999 all cellular telephone frequency
images produced with in a scanning receiver must be 38 db down from
the fundamental.

The " L " in the R-9000L stands for LCD. The CRT units are out of
production. The LCD unit, which replaces the CRT unit, retails for
over $ 1000.00 It is a color LCD when used in Video mode however it is
Black and White for general receiver operation.

Hi All,

I would like to invite you to join The Scanner and Communications SiteRing for those sites that have Scanner and general communications interest.

The Scanner and Communications SiteRing is a way to link Web sites of similar communications interests or topics to one another through a SiteRing Panel placed on each website that joins the Ring. All of the websites that join a Ring are linked to each other through the SiteRing Panel.

This helps bring a sense of community to visitors who use SiteRings to tour many sites devoted to one topic or area of interest, and in the process brings more traffic to the websites that are members of the Ring. This also helps to increase awareness of your site.

Presently we have three sites that are members and between these sites the total referrals have been 393 incoming and 387 outgoing. A tremendous opportunity to increase your traffic and to get your site out to the masses.

Click http://pub17.bravenet.com/sitering/add.php?usernum=1450511328 to join.

Talk about watching too much tv!

This does not even begin to approach reality. I can see it now.

"Hey, they just said our address on the scanner, the cops are
coming for us!"

"Damn, us sitting here with 5 kilos of coke, and all this meth,
full automatic weapons, claymores in the front yard, and now
they found us. Oh well, lets get out there with our hands up
so that we will have no violence when they arrest us"

Yeah, right.

Think you're giving Uniden a little too much credit... The BC245XLT
has at least two firmware versions. I have the first version with the
unwanted (& unnecessary) 5 second delay. They were in such a rush
to get this out that they ignored the suggestions made prior to the release.

In the case of the 780... while they were waiting for FCC approval,
I think they decided to fix the firmware in the 780, since it couldn't be
released yet anyway.

I think the 780 will appear just before Christmas. Perfect timing, IMHO.

BTW, Radio Shack doesn't make "their" scanners. Uniden and GRE
make many of 'em. ;-)

A TV splitter could be used but realize that at times the signals arriving from the 2 antennas may cancel each other resulting in low gain- at other tomes they may add or partially add.
Your best solution would be to use an antenna switch

FOIA permits a period which is "no greater than reasonable" for an
agency to provide the information. It can be argued that, since the
transmissions are being recorded in real-time, and that there is a
method by which the information can be gathered in real-time at no cost
to the agency (thus requiring no overhead reimbursement), banning
scanners is, in effect, denying a FOIA request without determination
that there is a exemption to compliance.

Are you saying that DES codings must be made public? I don't think so, unless things have changed.
Fifteen years ago I was told by an FBI comm. specialist that their DES (Digital Encryption Standard) codings were closely held. They're also virtually impossible to break. He said that searching for a single DES code would be like searching for a single ping-pong ball in the City of Chicago when it had a 10foot fence around it that was filled with ping-pong balls. Without the codes installed all you hear is the carrier go on and off. If an HT is lost or stolen they simply "kill" it by changing the codes on the other radios in the unit.
I can't imagine them ever releasing the codings, nor the Congress making laws which would require it. There's too much at stake.
Many small departments use simple "scramble" methods on their transmissions with impunity. I never heard of any Federal law requiring making that information putlic.

We have 'em all over Kent, Washington also...They're used with the wireless modems formerly known as Ricochet, now as...? Got one right across the street from me and that's what it's used for, I talked to the guys who installed it...They also come in another flavor, sort of a 2 foot tall by 1 foot wide and deep gray box with two antennas on the bottom and one on top...Some have little 900mhz yagis on them.

I also have a FRG 9600. Its one of the slowest scanners I've owned but as a communications receiver - its commercial grade & one of the best. Gotta like that beep, cause I don't know anyway to shut it off.

I have also seen these. One location was in the El Serreno area of Los Angeles. A microwave oven would be considered cutting edge there. I saw another one at Henninger Flats. That's a few miles into the mountains above Pasadena. Next to a microwave relay tower. My guess is that they are just telemetry.

It can be done without any insurance or inspection problems.

Use a metal chase and seal with fire calk.

Try http://www.radio-portal.org and click on "Search in broad". You then can combine two of the more than 60 categories. Aero related URLs are listed in the category "Utility Stations", with the second category you will be able to narrow down the results to your field of interest; frequencies, shortwave, VHF/UHF, addresses are some examples.

Have fun.

Actually, you can use a frequency counter and other
instruments in close proximity to some non spread spectrum
antennas and get usable results. Quite often at hamfests,
you'll find someone with a frequency counter or signal
analyzer offering free reports on some ones signal. The
practice is to turn on the transmitter, with its antenna
near the instrument's. That signal will be far stronger
than any other in the vicinity (and there are lots of
signals at a hamfest) and the instrument can accurately
receive it.

Dwight,

We should not forget that at one time it was often illegal to re-tune one's broadcast receiver to overhear police comms in the range just above AMBC. The more things change...

Hi,

I just moved into the NYC area recently, and I am looking for a full-service amateur radio and scanner retailer in the area. I did find one place in Queens already (Stewarts), but I'd like to check a few others as well. Any recommendations?

Also, an veteran NYC monitoring enthusiasts out there who could assist me in a good scanning "scheme?" By this, I mean how should I organize channels in banks and/or separate radios to be able to listen most effectively to public service (PD/FD/EMS) for NYC.

thanks for your responses. I will endeavour to monitor this group as much as I can, but I would be grateful for responses to also be forwarded to pjd at panix dot com as well.

Thanks!

Cheers, |The Second Edition of my book

I'm in need of suggestions on how to route my antenna cable from my attic to a room on the first floor. Ideally, I would like to route it behind the drywall and install an outlet box in the wall with the proper connector. I purchased some fish tape and began to try routing the cable but ran into the supporting 2x4 after a few feet. Anyone know of a good way to route this cable?
Thanks,

Greg

Are you trying to do this on an exterior wall? What part of the country are you located in? I ask this because building codes change in different areas and it easier to assume on how the structure is built. Some houses contain fire blocks. This is a 2x4 between the upright studs to keep fire from spreading up the wall. It can also be in the wall for strength, it all depends on the local building codes. One Thing is for sure. If you do get the cable down the wall I would not use a bulkhead connector I would leave enough cable to get to the equipment being used. Ground all equipment to AT least on 8' foot ground rod and keep in mind that you are giving lightning a direct path into your house. Instead of using the bulkhead connector in the house use it at the base (or within reach) of your tower and unhook it when not in use. Good luck

There is no such Federal law requiring police agencies to post the encoding scheme, or the actual coding sequence with anyone, anywhere, anytime. However, even the standard DES code can be broken with enough computer time. The purpose of using encryption on police frequencies is not total security, only privacy. There is a big difference.

Also, the only frequencies that police can arbitrarily transmit on without license, and the older "police" designated part of the Public Safety pool, and then with no more than two watts transmitter power.

In my in Northern Virginia we have these boxes hanging from light poles.
What they are is receiving units that receive data from the transmitting
electric meter on your home. The electric company just drives through the
neighbor hood and downloads this data into the computer in vehicle then it
is taken back to an office uploaded to a computer and then you get your
electric bill

The regulation of drugs was all based upon an illegal taxation scheme, as outlined in the recent History Channel series on the history of drugs. The Supreme's have ruled that requiring a tax stamp on a regulated substance is not illegal. Nor is it illegal NOT to issue ANY tax stamps at all. Most states, including Arizona, have actually printed marijuana tax stamps to prove that it is a legitimate taxation scheme. However, they will not sell you any stamps as long as the Feds declare it to be an illegal substance. Without this slight of hand, Congress would need to vote on each and every drug; whether to make it legal, schedule 4, schedule 3, schedule 2, or heaven forbid, schedule 1. (Schedule 1 means that not even researchers can get any to do experimentation on it for possible beneficial effects.)

America's next great hobby...tracking your neighbors location and biometrics!!!

Press Release

To Accommodate Overwhelming Demand for Invitations, Applied Digital Solutions Announces a Change in the Date and Location of Its Digital Angel Demonstration in New York City

The event will now be held on October 30th at Cipriani 42nd Street

PALM BEACH, FLORIDA, SEPT 22, 2000 -- Applied Digital Solutions, Inc. (NASDAQ:ADSX) , a leading, single-source provider of e-business solutions, today announced that it will hold its much-anticipated demonstration of its Digital Angel(TM) technology at Cipriani 42nd Street on October 30, 2000.

The company had previously announced that the event would be held on October 26th at a different location in Manhattan.

Commenting on the announcement, Richard J. Sullivan, Chairman and CEO of Applied Digital Solutions, said: "We've been overwhelmed with requests for invitations. In order to accommodate more people and at the same time a more centralized location, we decided to look around for a different venue. Unfortunately, on such short notice we had trouble finding a suitable site on October 26th. But we're delighted that Cipriani 42nd Street was available so close to our original date. This change allows us to hold this important event in a world-class facility right in the middle of midtown Manhattan."

The company now expects to issue as many as 250 to 300 invitations to interested members of the national media, potential joint-venture/licensing partners and selected Wall Street analysts. Attendees will witness a Digital Angel breakthrough: the first-ever operational combination of bio-sensor technology and Web-enabled wireless telecommunications linked to GPS location-tracking systems.

Background on Digital Angel®

In December of 1999, Applied Digital Solutions announced that it had acquired the patent rights to a miniature digital transceiver -- which it has named Digital Angel. In some of its applications, the tiny device is expected to be bonded closely to the body or implanted just under the skin. The Company believes Digital Angel will be able to send and receive data and be located by GPS (Global Positioning

System) technology. In addition to monitoring the location and medical condition of at-risk patients, the Company believes Digital Angel could have other applications that will prove to be extremely popular in the marketplace. These applications include locating lost or missing individuals or household pets; tracking endangered wildlife; managing livestock and other farm-related animals; pinpointing the location of valuable stolen property; finding lost airline baggage and postal packages; managing the commodity supply chain; preventing the unauthorized use of firearms; and providing a tamper-proof means of identification for enhanced e-commerce security. For more information about Digital Angel, visit www.digitalangel.net.

About Destron Fearing Corporation

Destron Fearing Corporation has been in the animal identification business since 1945. For over 50 years, Destron Fearing has developed, manufactured and marketed a broad range of individual animal identification products. The Company owns patents worldwide in microchip technology and is a leader in the world evolution of radio frequency animal identification. For more information about Destron Fearing Corporation, visit the Company's web site at: www.destronfearing.com.

About Applied Digital Solutions, Inc.

Applied Digital Solutions is a leading-edge, single-source provider of e-business solutions. The Company differentiates itself in the marketplace by enabling e-business through Computer Telephony Internet Integration (CTII&#65533;). With five-year revenue growth (from 1994 to 1998) of 64,012%, Applied Digital Solutions is ranked as the fifth fastest-growing technology company by Deloitte & Touche in its 1999 Technology Fast 500 listing. For more information, visit the company's web site at www.adsx.com.

Cross-posted to: rec.radio.scanner,rec.radio.cb,rec.radio.amateur.antenna,rec.radio.amateur.misc

greg,
Depending on how long a run it is, how you would have to
run the cable(s), I think you would be better off to make
the run outside your house, to your operating position,
maybe come in through a window.
It sounds like you live in a multi-floor house, if so,
going from the attic to the first floor can be a real
'pain', it just won't be easy. Following A/C or heating
ducting is one method. Having to follow room contours to
'hide' cabling will make for a ~very~ long run and may not
be worth the trouble (lots of loss).
If you aren't using one, a ground point where you enter
the house is a good idea. Think big when installing a
ground for lightning protection, normal size wire isn't
large enough for much protection (actually, none).
Good luck with it...
'Doc

The wall(s) are exterior walls and do have a fire block. I can drill a hole in the first fire block but the other one is obscured by drywall. I need to use bulkhead connectors for my application to be feasible but will be installing a good ground rod and a lightining arrestor.

Thanks,

Greg

I'm looking for a portable scanner that covers HF as well as VHF/UHF and has SSB capability (and, preferably CW). Are the Icom R10 and PCR1000 the best choices? From what I've been reading the PCR1000 is the better radio, but the R10 has appeal since it doesn't need the computer to work. Anyone have any strong feelings one way or the other about these radios?

Thanks,
Larry

Hi Dan,
Thanks very much for the tip. I will try to make it to Lodi next time I have business in Joisey <grin>. $10 in bridge and tunnel tolls for a window-shopping expedition are a bit high. Sounds like a great place...Good Ham retailers are always a gem to find, especially in the day of mail-order everything. It's good to pick brains and twiddle knobs now and then <big grin>.

Thanks.

>Also, what frequencies are in use on the Manhattan subway?
>Thanks,
>
>David Maddison

Hi David,

I have the AMTRAK freqs in a book that I will look up later this
evening. AS for the NY Subway, try these--depending on the division of
the subway you are riding on.

IRT (numbered lines and the GC-Times Square shuttle) 161.19
IND (some lettered lines) 161.565
BMT (other lettered lines) 161.505

These are repeater output frequencies and can be received easily
underground. All use PL of 127.3

Yard (Simplex) operations 160.845 (either PL 127.3 or Carrier Squelch)
This is often used crew-to-crew as well as for yard movements.

Signals and Communications crews use 156.105, no PL

Note: These are NOT just Manhattan frequencies. They are in use in all
boroughs. My book (URL in the .sig) details what frequencies are used
over which portions of track. I also have a bit on radio terminology (NY
Subway comms are VERY obscure to newcomers) as well.

> Thanks for the reply, though. :-) The mystery continues...

There could be a "hole" for one provider who wasn't using equipment on the tower. One of the problems is that there are often situations where "tower proliferation" occurs and zoning boards are getting tough with it. This might be a way to get around some of those problems for a company who can't get a contract to be on the main tower...

There is another possibility - it could just be that there is some new
generic microcell-type equipment available that can be implemented in a
number of (similar) ways - it's possible that it's being used in all the
different ways described in the postings in different areas.

Very true but you need a car to get to there. Most people who live in NYC
don't own cars (no parking.)

Whatever you do, STAY AWAY FROM BARRY ELECTRONICS, they charge list and over
(depending on if they think you're American or a foreigner.)

If you have to use an exterior wall why not use a piece of 1/2" conduit and surface mount it to the outside of the house. Use a junction box with a hinged cover on the outside and you can disconnect it in the box during dangerous lightning storms, or you can use a condulet to enter through the house. You could also use wiremold brand raceway, they sell it in different colors and different sizes and also in UV resistant outdoor plastic. Just a thought.

I looked on the AES site and found that they did not carry the Optoelectronics. Are there better prices to be had from other dealers or do you need to buy from Optoelectronics www.optoelectronics.com direct? What is the best price on the Scout? And is the Scout Model 40 the most recent version?

Since it is best to buy extra antennas is there somewhere to get a good deal on a package deal?

Definitly agreed. I don't believe in restricting universal citizens'
right to receiving access to ANY part of the spectrum. It's about as
sensible as banning handguns and expecting no blackmarket supply to
develop, even as the blackmarketd in illegal drugs flourishes unabated.

ANY entity which demands and needs communications security should be
required to obtain it through technology and private use of the
hardwired telephone.

In our city we recently installed a system that uses rapidly pulsed strobe lights on emergency vehicles to activate a receiver on the intersection lights, causing them to make the green light available to emergency vehicles that are approaching. Each vehicle blinks a unique pattern. The results are logged on a central computer, so there is a record of which vehicles went through the intersection and when.

No RF is involved.

The system we are using can be seen at:

They are for the Ricochet data network. We've had them in San Francisco
(one of Ricochet's first two cities) at 28.8kbps for several years.
There's been a box/antenna like this on a pole near my house for a few
years, and I also was shown one in a Ricochet booth at a computer show.

After being in only two or three cities for several years, Ricochet is
now expanding. See http://www.metricom.com

You can record directly to hard disk with ScanRec, www.davee.com . It has
a software squelch control.

Is this the same ScannerWear as the one called "ScannerWear Soft Control
2.5"? There's a current (says April 2000) web site for the company at

http://www.radioscan.com/

Look at VisualRadio. www.visualradio.de. Their software, while pricey
($100) does detect when squelch is broken on an R-10. I'm trying to
figure out how to afford it as the lack of squelch detect in most
software has disappointed me in trying to computer control my R-10. None
of the other "popular" software packages seem to be able to do this.

Continuous band scanner through 1.3GHz. Fully programmable with 500 channels, 20 banks, 20 priority channels, alpha num. illuminated display, auto store, VFO know, WX search, Turbo scan , aux tape output, weather alert, selectable delay, reception counter, step select. This is from an estate sale and I have no manual for it, however I can provide a BC9000XLT .pdf file which I understand is very close to this unit. Includes power cube, telescopic antenna, but no CTCSS option. $235 includes shipping to US only.

>purposes. I know it is weird, but remember you have a "radio receiving set".

Come back down to earth. If the FCC licenses an LE agency to operate
on an international maritime frequency, that does not turn that channel
into a "police" frequency. It only gives that agency authority to
communicate with the maritime industry on that channel.

Some LE agencies used to monitor CB Channel 9. Doing so did not make
Channel 9 a frequency for "police purposes."

You're getting paranoid over this matter.

Hi,
Nice drawing. Based on what I see, these should look very familiar...

http://www.williamcalvin.com/bookshelf/PoletopLocator.htm

Scroll down to the middle of the page and you'll see the Ricochet
antennas. Congratulations you're about to be covered with 128kps
mobile ip (not 3g, god knows when you'll have that! Probably never at
the rate it's progressing.)

go to http://www.ricochet.com if you want the details.

I would agree with your conclusions, but would add one
criticism, the IC-R8500 has a pitifully slow squelch action.
I found that a signal needed to be present for up to three
quarters of a second before the squelch realised and
opened. That was with the squelch right on threshold.

Oh and the only thing you have gone 'overboard' with is
running a pair of Paradigm Titans on the thing!! OMG!
I have a pair of Paradigm Studio 80's.. hmmm but they
ain't hooked up to my AR-3000.. that's for sure.. hehe.

By the way if you're curious as to what 128kbps of mobile broadband looks like from the inside out you can see the internals of one of those radios here:

http://www.conway-engineering.com/micrortu1.html

This is actually an antenna from their older 28.8 service but you get the idea.

After spamming six different newsgroups, five of which do not deal with scanning, I can see why you dont have the time or inclination to revisit each one to look for replies. You just do your spamming and run.

Next time, post your question to the appropriate newsgroup (rec.radio.scanning only) and be prepared to return to it to read replies and maybe even participate in the activities of that newsgroup.

Try to be a good netcitizen.

Scanmaster Tunable Notch Filter SNF170

This Scanmaster Tunable Notch Filter is in brand new condition (it has been opened but barely used).

"It will work well on any base, mobile, or handheld scanner and will knock out pager interference or FM transitter interference in the 85 - 175 MHz range."

Here's the link to the auction...

977. Hulcher Emergency Service

Newsgroup: rec.radio.scanner
Date: 2000-10-17 00:00:00 UTC
From: Terry Weatherford <terry@weatherford.org>
Message-ID: <suq5n3qufo78f2@corp.supernews.com>
Source record: 77564

I was about to send the email below, when I finally found this....
KCT466 "IG" Hulcher Emergency Services, Denton Texas....
Does any one know of any other frequencies in use?

Using the call sign look up in FCC database... I find a base station for
43.04, 43.44, 43.32 and 900 mobiles for each....

Funny thing is, 43.44 and 43.32 do not show up in PerCon....

???

Thanks
Terry

(Original Email)

I am looking for frequencies that this company uses. Looked in PerCon and
FCC and can not find anything under "Hulcher".

The only thing I've found was through searching msn.com... found a frequency
site in South Central PA that lists 43.04 for the company.
This is the same frequency they used to use years ago in Macoupin County,
IL.
The article below states that they have GPS systems... maybe they use a lot
of cell phone??? or NexTel?

They started out in Virden, IL in the pipeline business and now do lots of
recoveries....
see story at....
http://www.railspot.com/gif/mail/railspot/jul99/msg00258.html

Here is their bio.... can any one help?

Hulcher Services, Inc.
611 Kimberly Drive
P.O. Box 271
Denton, TX 76202-0271

Hulcher Services, Inc., located in Denton, TX, is and emergency
response company that specializes in the clean up of train wrecks and
industrial and
natural disasters throughout North America.

> Before you buy.

Of course.....the First Floor in the US is the Ground Floor in the UK...this is why I couldn't see your problem at first.

Over here, drilling through the ceiling would in most cases get you from the attic to the First Floor.

I had the same solution to a similar problem of an antenna mounting on the chimney stack, I led the coax down the stack, through the roof and into the attic, along the attic joists, out through the attic air vents, down the exterior wall, and into the wall on the Ground Floor.

If you're running VHF make sure you get low loss coax.

I show the IP as 216.157.29.195
I trace my route as Winnipeg-Toronto-New York-Atlanta-Florida.
Maybe it's a router problem somewhere....

Just the opposite. "Pull" or not, smaller orders are MUCH easier to get
filled than large ones.

The margins on something like a high end scanner are much higher than
those on a PSX2, meaning Uniden can afford to pay a little more for parts.

What a TROLL - I guess that since you have less than 3 months experience in the Navy you OBVIOUSLY know more about it than my 20+ years. Get professional help - you are sick. (by the way, leadership training is a one week info course on how to conduct oneself without making a fool of yourself - you must have failed)
I will not reply any further to your pathetic attempts to justify your self inflated ego. You are a Legend IN YOUR OWN MIND !! I was serious about the professional help - get it before you find out first hand what a "blanket party" is all about.

You are correct, however, once you have already enlisted, the only way to a commission is through the LDO [Limited Duty Officer] program. People with Master's degrees do not enlist - They are commissioned right from the start. Very few Commissioned Officers came from ROTC or the Naval Academy, most come from various colleges. Check out the facts before you start taking them out of context to suit your illness. With your personality disorder, I seriously doubt that you will last long enough to make E-6 without professional help.

I use an "N" type bulkhead for low loss.
It just looks better.
Cable guy who did cable modem install really had questions about
that large connector.
I had to inform him.
Also, my wall had no supporting horizontal 2x4's between the studs
so the fish was fairly easy.
Although, I had to drill through several stacked 2x4's at the top of the
wall.
I had the drill a smoking that day.

Most N connectors are 50 Ohms and not the 75 Ohms that TV (and cable modems) call for. Some N connectors are indeed 75 Ohms, but not many! In Greg's case it is probably easiest to go down outside of the building and in the wall. It doesn't make for the neatest install, but the cable TV monkeys get away with it.

My thoughts on the delay of the 780:
If Sony cannot get enough parts (resistors and caps) for the new Playstation 2 video game and must scale back shipments to stores (due out around Oct 26) because of the worldwide shortage of these parts. What chance does Uniden have of getting these parts for a unit that will have far less sales by comparison. I would think Sony would have more "pull" to get the parts than Uniden would from these suppliers.
IMHO

Sounds good, just don't see anything about pricing. That usually
makes most people move on to the next thing. The marketing department
should work on that.

Easy way out is to make a small hole in the ceiling of the nearest closet and bring the coax down through there, out under the door and over to the rig.

Or, if you can get by with it, just make a small ceiling hold in the corner of the shack and bring the cable down there. Easily patched with a little spackling paste when no longer needed for the cable.

You might also be interested in listening to the long-range air-to-ground SSB HF frequencies, too. Maybe someone on here can give you the list of ARINC frequencies; I've since forgotten them, and the ARINC web site doesn't seem to list them.

Ty-wraps with the tags you can write on would seem to work well
if you don't like goopey tape.

Not too sure where to obtain them though.

Hello all

Was thinking of purchasing the R2, just wondering if anybody had any opinions on it, how it performs. I think here in Canada, they ones they sell are unblocked, but how is overall sensitivity, etc... Does it have an auto tune or scanning feature. Any info is greatly appreciated.

Thanks, Jason

1029. EF Johnson Multinet 2 How to Track

Today the Naval Investigative Service in San Diego received a disk and hard copies of the last 4 months of post by John Macky. LTCMDR C####e was extremely receptive to us. He was sympathetic to our problem and said "He was very concerned about this person". He explained that there are some sections of the UCMJ that might be pursued. The NIS has jurisdiction and enforcement duties for all naval personal.

He did *promise* they would investigate, and filled out an evidence form for the disk and hard copies which I also signed. A statement of complaint was also taken. I stated the I beleive that this person might pose a possable threat to the armed services of the United States. The LTCMDR even helped with the wording of the complaint.He told us that any investigation by the NIS would become record and *could* result in criminal charges...at the very least there would be a permanent "red flag" in his files.

Since it is NIS policy not to comment on any type of investigation we most likely won't get an accurate play by play of how it turns out. We were also told that there is always the possibility of an impostor claiming to be enlisted in the USN...they can deal with that also we were assured.

I signed on the dotted line to get this crap to end. The complaint has been made.
I stand by my complaint and it's onfile at NIS in San Diego, CA.

NIS can be reached at 619-556-1364 they are very nice to deal with and seemed genuinely concerned about this person. Maybe it will work...maybe it won't. It only took 45 minutes out of my day...so no biggie.

Mark

My Goodness loony!....remember, even though you're a little reservist attached to the Naval and Marine Corps Reserve Center of 6735 N. Basin Avenue, Portland, OR. 97217-3993,.....

You're still obligated to carry yourself in a professional manner and treat all naval personnel, whether they be active or retired with the respect appropriate to their rank, (be they active or retired). Failure to do so could result in disciplinary action in accordance with the Uniform Military Code of Justice. Specifically, "conduct unbecoming of sailor" comes to mind....

If you require guidance on appropriate behaviour of reservist program participant, I suggest contacting your senior commanding officers and chiefs listed below. (I've included their phone numbers for your convenience.)

(503) 285-4566, When prompted you can enter the extension number or press # 2 and type the FIRST 4 letters of the last name of the person that you want to talk to and the system well transfer your call to the proper extension.

Commanding Officer, Capt. P. A. Anderson, extension 510
Executive Officer, LCDR P. A. Sharp, extension 511
Command Chief, YNC J. E. Smith, extension 533

(If you want,..... I can forward your posts to the Command Chief, and then he can come looking for *you* to address your concerns. I'm committed to making this as easy as possible for you.)

You're welcome...

You friggin' loon.

When they fly check flights, I've heard the leader calling the steps on 141.85 (or maybe 140.40). The transmission is pretty weak though, listening from downtown Hampton when they fly almost overhead. Good luck.

Cheers,
Peter

Some of these answers are scary, do you guys really have scanners? It is the DAMN DATA NOISE! 57 varietys, of all kinds of data crap, sometimes I get a microwave signal that will take 15 frequency steps in a consecutive row up--I have to keep pushing the arrow button to get past it. Some scanners have data buttons that are supposed to skip it, but they don't usually work like you would think. I have found some scanners lock onto the data crap and won't let go, and other models, like the pro 2032, tend to drop data in about 2 seconds, I don't know why but I am thankful, maybe some designer really understood what he was doing....

There is no inherent problem with this well - repected (and high-performance) scanner. I have had one for years, and it will pick up stuff with NO antenna attached, from several miles away! My regular antenna, which is up about 40 feet, with Belden 9913 coax, can hear more than 40 miles in any given direction. It still stacks up , sensitivity wise, with my Optoelectronics Optocom. It is more likely that something has gone wrong with the radio, perhaps a nearby lightning strike has wiped out the first RF amp, Or maybe somebody tried to "improve on the alignment" of the slugs and adjustments at one time or another (a definite no-no, unless you know what you are doing).

> my pro 43 or 2032. Is there a common problem with these units?

One possibility is RF overload. I also own a PRO-2006 and live in the greater L.A. area, where a lot of FM radio transmitters are apparently close by. Their signals are so strong that they cause the scanner to overload between roughly 50 MHz and 300 MHz. By placing the attenuator at -10dB, the noise level on all signals in that frequency range drops significantly (and signals otherwise invisible can then be received).

Since I'm on the subject, I may as well ask a question to the group for myself. <g> Is it possible for strong signals (such as from close-by FM and TV broadcasters) to damage/desensitize the front ends of receivers like those in scanners? One of the handful of FM stations causing the aforementioned headache for me is KIIS 102.7 FM. It's signal is so strong here that my PRO-2006 cannot even produce intelligible audio from it once tuned in. (I must remove the wick and/or external coax from the unit before it produces clean audio -- and in that state, without *any* antenna connections, the signal is full strength.) So, I'm curious if such a strong signal could possibly desensitize the unit. (I haven't seen any evidence of it, but I'd still like to know of any possibility.)

I bought this new in 1985 and finally decided to be a criminal and try and listen to cell phones, but I could not get it to work! the AM-FM LCD display is wrong on the unit..(when it says FM it is really AM etc), and I compensated for that. I have listend to police compensating for the AM-FM bug in the past so i am sure about the am-fm display bug.) I use the included small 800 Mhz antenna and still could not hear anything when I scanned the cell range..what am doing wrong? Geesh, I try to break the law and have some fun and it does not work. ARGHHH!!!

1068. Re: Why can't I hear any cell phones on my Regency HX-2000 scanner?

Newsgroup: rec.radio.scanner

Source record: 77579

PS..the directions have info about the correct chanel scan spacing to listen
to cell phones and I did that also but still can not hear anything in the
cell bands. This radio for sure has full 800 MHz coverage so that is not the
problem...

1069. pro 2006 has poor reception

Newsgroup: rec.radio.scanner
Date: 2000-10-18 05:38:25 UTC
From: Noe Idintuficatun <dontusethis@nospam.com>
Message-ID: <8sjcu7nnu1@slb7.atl.mindspring.net>
Source record: 77580

I have a pro 2006 recently acquired. It has bad sensitivity. My other scanners can be right next to it and pick up a lot more signals. I have tried it with the factory antenna and my roof antenna plugged into the back. Still only picks up strong signals. The attinuator on the back is set to 0. It will pickup lots of frequencies, but not nearly as many as my pro 43 or 2032. Is there a common problem with these units?

1070. awsome scanner

Newsgroup: rec.radio.scanner

I have this catalog with this kick ass scanner in it. It has coverage from 495 khz to 2.45 ghz. And it has this 2 inch color monitor for watching video feeds. They've reported receiving tv broadcasts directly from satellites only using the whip antenna. And the thing is totally portable - at about 5.5 inches high. all for only $550. hehe.

If you live in a rural area, not near a cell tower. It can take quite
some time to find activity. I took a Pro-43 with me to a friends house
in the country. I would only hear a conversation about once an hour,
and very breifly.

Hello all! I need to sell this radio, to feed my other radio hobby, of collecting vintage transistor radios. It comes with the box, manual, and rubber duck antenna. It is in excellent condition, and works well. This is the standard US version (which is blocked). I am asking $200.00 US for it, payable by US Postal money order. Inquiries should be directed to me directly at rgs2@obviousqwest.net, removing the "obvious", of course. I will entertain interesting offers as well; perhaps a trade of vintage transistor radios? Thanks for reading. -Bob

OK, you're right. I was hearing West L.A. (42.44) which I believe was drifting off frequency due to another scanner in the room. There are about 8 scanners all sharing the same antenna. I am still amazed that I can hear traffic from Indio here in Hollywood.

Anyway, now that I've got this figured out I can stop scanning that bogus frequency. Thanks!

ARRL APPROVED LONG ISLAND HAMFEST - October 29, 2000

LINDENHURST, LI - NY

On October 29, 2000 the Great South Bay Amateur Radio Club will again sponsor an indoor Hamfest-Computer Show. The location will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.
This is an ARRL approved Hamfest.

There will be radio equipment, electronic components, computers and accessories, software, books, technical manuals, ARRL information, Amateur Radio License Exams, Door Prizes.

Advanced registration is $15.00 each table. Tables at the door are $20.00 each. Contact Walter Wenzel KA2RGI at 631 957-0218 for table reservations. NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space available.

General admission is $ 6.00. Wife's and children under 12 admitted with no charge.

VE - ARRL - 12:00 NOON at Babylon Town Hall, 200 E Sunrise Hwy, Lindenhurst. For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID),
and the examination fee, to the exam session. Current ARRL/VEC fee is $ 6.65,
exact change is appreciated.

Talk-in will be via GSBARC Repeater on 146.685 -600 136.5 PL.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 PM following the Newsline Report on the W2GSB repeater, 146.685 -600 136.5 PL required. You may also write to:

Great South Bay ARC
P.O. Box 1356
West Babylon, NY 11704

E-mail GSBARC info@gsbarc.org or visit GSBARC online at

You are an idiot! What would newsguy.com care what anyone did if it wasn't posting from their servers? Shut your mouth, you are a stupid bastard and you are the one who has never posted on topic. Yeah, I know how you're gonna reply to this.

More off-topic instigating banter sent to abuse@newsguy.com

But thats ok because you're a moron.

David

1089. BC780XLT antenna inputs

Newsgroup: rec.radio.scanner
Date: 2000-10-19 00:00:00 UTC
From: "Michael D. Blaise" <blaise@cptelco.net>
Message-ID: <39EEF9CD.DD46AD87@cptelco.net>
Source record: 77416

I wonder if the 780 will have 4 different antenna inputs on the back, so you could hook up a specialized 800Mhz, VHF low, VHF high and UHF antenna if you wanted to all at the same time. Even 2 different antenna inputs would be good, one for 800 MHz and one for the rest of the frequency bands. Has anyone heard anything about this?

1090. Re: Icon R2 opinions please

Newsgroup: rec.radio.scanner

The R2 is in fact a great little receiver, EXCEPT if you live in a
high RF environment, i.e. pager, and cell towers located very near by.
I happen to live in such an environment and it can at times make my
little R2 go crazy. The R2 does exactly what its suppossed to, but
I'd think twice about it if your prone to alot of intermod.

From: Lou <tech@dp.net>
Message-ID: <8snbdb$5ac$1@news.dp.net>
Source record: 77432

Hi,

Thanks for reading.... Does anyone know of a website or have the Repair AND/OR Owners manual for the Regency Z30 Scanner?

I just acquired one and need any and all info I can get. IF you HAVE said info, let me know cost to ship. Please reply directly to me.

Until I can get said info, does anyone have any idea of the type of memory system backup and sensitivity of VHF highband and it's limits?

Thanks again.....

1106. BC 780 Questions (Specs, not release date)

Newsgroup: rec.radio.scanner
Date: 2000-10-19 00:00:00 UTC
From: som9k7e5@aol.com
Message-ID: <20001019142042.22155.00000200@ng-fj1.aol.com>
Source record: 77433

Hey all,

I was wondering if anyone knew how the 780 was going to work? I know if I ask when its going to be released I would get 780 different answers (And that is just from Uniden themselves). seriously, Is it going to trunktrack LTR systems like it doesnt Mot/EDACS or is it going to be like that lovely Pro 92 :) Also, will it have the CTCSS feature like the BC 895 where you can have PL set on one frequency, but still search on others in the bank. any other changes or things like that anyone know?

Thanks in advance,

Tim

1108. Cheney Visits Minneapolis, MN - Frequencies Wanted

Newsgroup: rec.radio.scanner
Date: 2000-10-19 00:00:00 UTC
From: Robbin Olson <rolson@mcg.net>
Message-ID: <39ef5aa8$1@news.mcg.net>
Source record: 77435
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I just heard that Richard Cheney will be visiting Minneapolis, Minnesota on Friday (10/20/2000). Is anyone aware of any interesting frequencies that will be used during his visit?

Thank you for any suggestions.

1109. Albuquerque, NM frequencies

Newsgroup: rec.radio.scanner
Date: 2000-10-19 00:00:00 UTC
From: j4444@fnmail.com
Message-ID: <8snoskmoa1@nnrp1.deja.com>
Source record: 77436
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I will be visiting Albuquerque, New Mexico Oct 31st through Nov 4th and am planning on taking my scanner along. Does anyone have any frequencies that would be good for listening to in the area? My scanner is not capapble of 800 so any trunked or anything up in that area would not be useful. I also would be interested in any amatuer frequencies (6 meter, 2 meter, 440). You can email them to me at john_murphy@und.nodak.edu or if there is a website I can go to to find these that would be ok as well

Also does anyone know the Northwest Airline poolicy on using scanners in flight. I know the stantard things about not during take off or landing, but anything else would be helpful.

Thanks to anyone in advance for any information you provide!

John Murphy

I wish you people would stop talking about "Mackey" . I certainly don't care who he is or what he did.

this is a scanner group and you should talk about scanners and freqs and stuff. if you hate this Mackey fellow so much you should start an anti-Mackey newsgroup.

to sum it up STAY ON TOPIC!

>antenna if you wanted to all at the same time. Even 2 different antenna
>inputs would be good, one for 800 MHz and one for the rest of the
>frequency bands. Has anyone heard anything about this?

No, but it's high time we saw something like this in a modern scanner. Having a single antenna input on scanners that cover 25-900+ MHz is laughable. A radio like the 780 should have at least 2 inputs, and the selection of each should be programmable per channel. IMHO this is the most sorely needed feature in a scanner today. I'd glady trade computer control ports or CTCSS decoding for multiple antenna inputs.

There is NO comparison....one is a apple..the other an orange. The PCR-1000 is an excellent receiver...but hardly portable.

Actually, the traffic on this freq is a simulcast of the West Valley (42.50) frequency. Funny thing is, they don't always simulcast.

I'll have to try another scanner. There are a lot of radios in this room so I may be picking up something generated by one of the other scanners.

It's a klunky scanner, useless for HF (shortwave) due to its insanely
wide AM filter. Icom always falls short, somehow.

This is the portable I want:

(From the Drudge Report - 10/18/00)

STATE DEPT MEMO: DEATH OF US SAILORS DOES NOT COMPARE TO PALESTINIAN TOLL

The United States State Department believes the "17 or so dead sailors" on the U.S.S. Cole "does not compare to the 100+ Palestinians who have died in recent weeks" in Mideast violence, a stunning government memo reveals.

The Clinton/Gore Administration disapproved a VOICE OF AMERICA broadcast condemning the attack on the Cole. A memo from the Executive Secretariat Staff at the State Department stated:

"The Department of State does not clear on the referenced VOA editorial.

"This editorial will reach an audience that is caught up in the violence in Israel and the Occupied Territories. The 17 or so dead sailors does not compare to the 100+ Palestinians who have died in recent weeks where we have remained silent. The people that hear this will not see the separation we are trying to make and relate it directly to the violence.

"Either VOA adds something in there to take the edge off and mention the Palestinians or we should kill this editorial until the violence has calmed for a while.

"S/CT [Secy. for counterterrorism] concurred with this. If you have questions concerning this editorial, please contact NEA/P (unintelligible)

I have to agree here.... Just cut a small hole in the ceiling and
thread your cables down. Slip a white PVC pipe over your cables and
you can paint it if you wish a finished look. My attic dipoles drop
right down to the shack..... Why would you want to mess with running
any cables through the wall? Simple is best.

I simply must jump in here in defense of the R-2.

Anyone buying this radio for HF , (SW listening) is insane. We all
know that these hand held wide coverage radios do not cut it in those
areas. Although I can pick up most major SW stations pretty well
using the GROVE Active Duck, this is simply a bonus band for these
radios.

However, I simply love the size and performance of this radio in other
areas. CTCSS is great, sensitive, with great audio for a radio this
size.

I picked up an absolutely MINT used one, with case, ICOM software and
cables for 120 bucks. A steal.

Even new, they are reasonably priced, and for a drop in shirt pocket
radio, it can't be beat.

OK, you know that funky connector on the side of the AOR8200 scanner? What's it called? I know AOR sells (or used to) a cable called the OS8200 that was just the connector on one end and bare leads on the other. They also sell the CC8200 which is a complete cable with the RS232 level converter, etc. That's all great (I actually have both) but I still want to know the name of the connector to see if I can find a supplier.

Thanks in advance for any input.

Go read the review at the below web site. I bought my IC-R2 after reading this review and I have had no regrets on buying the radio. Yes it doesn't do "everything" I would like for it to do, but it is a good handheld for what I use it for. It's not my only handheld and it's the one I grab the most when I'm walking out the door.

There are such things as auto-tuning combiners... This means transmitters can change transmit freq on the fly without manually retuning the combiner. The loss on this type of combiner is usually greater than a standard combiner and they typically have less power-handling capability, but they do exist...

At work, we use Brady Labels. The company has various styles and materials
but the ones we use are clear, except for a white bar on one end. You can
write on it with a pen or pencil, then adhere it to the cable. The clear
portion
wraps around the cable, covering the white bar. The material welds to
itself
and must be cut if you want to remove it. It is weather tight and probably
is permanent. I've personally used these labels for the past 7 years and
never
had one fail or degrade. Not cheap but if you plan on labeling a bunch of
cable,
it is worth looking into. Here's one source:

http://www.scanlite.com/brady.html

I'm not affiliated with their products or the company.

Make sure that the frequency(ies) that you are trying to listen to are
active (check against another scanner.)
Try another antenna and see if that works (the antenna or connector may be
broken.)

I generally detest using tape as it leavs a very sticky residue when removed. While you can go to any good electronics store and look for wire marker solutions (there are dozens of 'em from Bardy, 3M and the like), all of them will probably be adhesive-based.

If your installation is considered permanent, and you just need a way to identify several coaxes (sp) by looking at them, try a bit of paint or your YL's nail polish.

Me, personally? I use a terrific little doohickey from a company called ZipTape. The product is called Rite & Wrap II. It's a roll of clear plastic peel-and-stick adhesive tape tabs. Each tab has a white writable area. You write what you want on the label, peel the tab off, stick it to the wire and wrap the clear tape over the written part--you can see what the label says without risking damaging the label or having it move all over the place. The only downside is that it leaves a gooey mess when removed, and it's not that easy to remove in the first place. That's why I only use it on installations that I'm sure aren't going to be messed with for at least 6 months.

With the rapid move to digital cellphones, you may not find very much analog
activity in certain areas, especially if you're in a rural area.

In my turf they just run the cable outside of the house and use one of those bad-ass 18" long drill bits to -get into- the house. I think it makes a mess of the brick work and would never do it myself. I managed to wire every room in my pad without any wires being -seen-. It just takes a little more thought and effort but when it's your own place it is worth it.

My apologies for painting all cable monkeys with the same shit-covered brush. :)

1168. South Seattle: Descending tones from 144 MHz through 144.0043 MHz?

Newsgroup: rec.radio.scanner
Date: 2000-10-20 00:00:00 UTC
From: tharkun@nwlink.com
Message-ID: <8sqh1s$2f0_002@news.nwlink.com>
Source record: 77476

Hi -

I just ran across a sequence of tones, starting at the high end of the audible frequencies at 144.0000 MHz, and descending to the very low tones at around 144.0043 or so MHz.

Any ideas as to what this is?

Craig

The calm is on the water and part of us would linger by the shore,
For ships are safe in harbor, but that's not what ships are for.

Hi. I like my scanners but since I almost never use them anymore this one has to go. It's in very good shape and has had it's bandplan modified for better programing here in the USA. It has also been restored to full coverage; no gaps at all. If needed I have an Optoelectronics interface to connect it to a computer. The scanner includes four NiCads and it's charger/adapter and antenna. I think I still have the box it came in too. Please email me if interested. Thanks!
-Aaron

It wasn't on the auction block for long. The auction for this scanner has been
canceled
because of the cellular modification reference in the seller's description.

For the uninformed, eBay has been canceling auctions for "cellular modified,"
"cell capable," and "full coverage" scanners for several months now. If you
use any of these phrases in your description of the scanner, I'll guarantee
eBay will cancel your auction within 72 hours, probably sooner. If you want to
auction cell capable scanners on eBay, you must be very discrete about the
radio's frequency coverage. Oh well . . . better luck next time.
73,
David

Hi all. I listen to the NYPD all the time, and I always hear the term EDP. For example they tell Emergency Services to respond to an EDP (or EDT - something to that effect). I was wondering if anyone knew what this means/stands for. Thanks.

I have more than enough 2006s but if you're POed at eBay you can go
there and look for cell capable scanners then report them to
safeharbor@ebay.com
Ebay will pull the auction and it costs them money to turn away sales.

1187. UHF Trunked system scanning

Newsgroup: rec.radio.scanner
Date: 2000-10-20 00:17:58 UTC
From: brett4083@aol.com
Message-ID: <20001019201758.04992.00000124@ng-fc1.aol.com>
Source record: 77452

Hi, I am new to scanning but I do have specific questions. I just came into possesion of a Uniden Trunk Tracker II BC245. I also drive a cab in Fort Lauderdale and I own a Motorola 1225LS UHF two-way radio. Along with 6 other guys (who also have the Motorala two-way), we get our radio service from a provider and have 2 dispatch channels. The provider has us on a 450Mhz UHF trunked system and for his personal ethical reasons (other companies sharing the freqs) won't divulge the freaking frequencies. Okay....I went to the FCC web site and was able to find what I think were the frequencies assigned to this provider in the 450 to 470 range. I entered all the freqs. into the scanner (in the trunk mode) but I'm not sure that I did everything right. I don't hear anything on these freqs. so I'm not even sure I have the right freqs.

Now for the specific questions I was talking about way earlier...
1.Where do I find the "base" and the "offset" frequencies which are required to scan the UHF trunked systems?
2.Are they part of the 10-15 frequencies listed as assigned to this provider?
3.Is there a good way to find 450+ UHF trunked frequencies?
4.Is there a newsgroup or club or BB that might be familiar with this "fairly new" 400+UHF trunked systems?

Thanks for your help and responses......Brett

other

The Motorola 1225LS is an LTR trunking radio. The BC-245 is not capable of
tracking that format. You need a PRO-92 to do that.

Lou,

I have a Z30. It was my first scanner and still works. I also have the Owners Manual. If you want a photocopy of it please send me your mailing address.

In the meantime the answers to your questions are as follows:

a) the owners manual claims that the memory system backup is a capacitor that should retain stored frequencies for approx. 1 week. Mine does not retain storedfreqs for even 1 hour.

b) VHF Hi sensitivity is as follows:
(12 db SINAD at tune up) at 159.9 MHz is 0.4 micro volts
(12 db SINAD, maximum) 144 - 170 MHz is 0.7 micro volts

Hope that helps you. let me know if you need any additional information.

Just relist the radio in a few days WITHOUT the "cellular modification"
description... I sold a 2006 several months ago there and used the simple
term "has had performance enhancements" in the description...interested
buyers can always email you to confirm

Slowly they are...
The Border Patrol has astro on 2 channels in the Western Region.

The Seneca (harris made) radios have not been seen around Socal yet. wait till those start popping up...all kinds of fun stuff attached to that system including finger print data,video and GPS. Anybody see the radios in use yet?

Source record: 77368

Greetings,

I just purchased an ICOM PCR-1000 PC receiver. So far it works great, however I have a question about scanning multiple banks. It appears that you can only scan one bank at a time. Is that correct? Is there a way to scan ALL banks? Final question: is there a good web site dedicated to this receiver?

Thanks!

Dan

Message-ID: <20001021144704.07549.00000845@ng-fm1.aol.com>
Source record: 77371

Speech/Frequency Inversion is accomplished by mixing the speech spectrum (typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz constituting the speech inversion.

1220. Uniden Command Set for PC Control is Limited.

Newsgroup: rec.radio.scanner
Date: 2000-10-21 00:00:00 UTC
From: res008wn@gte.net
Message-ID: <83pl5.3420$nn6.246365@dfiatx1-snr1.gtei.net>
Source record: 77378
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I am a Delphi software programmer and can develop full feature quality software including a nice user interface. I'm starting to make a program for the PRO-2052 and will port it over to the BC 780XLT(when released). The problem is the scanner's firmware commands(PC to scanner).

The programming is more complicated then the PRO-2006 w/ CE232 interface. On the PRO-2006, I send a "F" byte and receive back 26 bytes telling me everything displayed on the scanner display window. With the PRO-2052. I have to send commands to check the "MODE", then the "BANKS" selected, then the "SQUELCH", then the "MODULATION", etc...

I got this far...now the problem. When the scanner is in the "LIMIT SEARCH" mode. There is not any command(documented anyway) that can tell me the current searching frequency or more important, an active frequency in the limit search mode.

A visit to the UNIDEN site showing the BC 895 XLT command set almost identical to the PRO-2052. and therfore it's likely the BC 780XLT commands will be simular

Bottom line is...I hope UNIDEN adds to the BC 780XLT a single command to send back a series of bytes telling me everything displayed in the display window this way my program (or anyone's program) will not have any limitations.

Are you listening.. UNIDEN

1223. Burnaby BC RCMP FREQUENCIES <<<EDACS!!>>>

Newsgroup: rec.radio.scanner
Date: 2000-10-21 00:00:00 UTC
From: Ron Olin <ronolin@telus.net>
Message-ID: <8gpI5.116325$86.8724753@pouncer.easynews.com>
Source record: 77381

A while ago I posted a message wondering if anyone out there knew what happened to the Burnaby RCMP frequencies.... Well last night my wife and myself went through a checkstop... (which gave me an oportunity to ask an officer if they changed frequencies).... well my fears were realized when he said that they had changed to e-comm (which is the same as Vancouver)... and I got a chance to look at his new Ericsson portable... I guess that scanning in the lower mainland days are numbered (as Surrey, Copuitlam, Langley....) are sure to follow suit.
Does anyone out there know if any scanner manufacturer is working on a Pro-Voice decoder? as even a trunking scanner is usless (as you just end up receiving a digitally encoded sound)... I looked into buying a LPE 200 and almost had a heart attack when I heard the dealer mention $2500! (Canadian)!
TIA for any information
Ron

They are Metricom/Ricochet wireless data network boxes. They are rolling out their 2nd generation of technology which uses unlicensed spread spectrum at 902-928 Mhz and the 2.4 Ghz Part 15 allocation. They also use licensed spectrum that they acquired at auction in the Wireless Communications Services allocation near 2.3 Ghz.

User radios, about the size of a celphone, attach to your computer and communicate to the network nodes, known as "pole top digital repeaters". Range is about 1/4 to 1/2 mile from your handheld to a pole top, typically. The pole top then forwards your traffic towards a wired access point for entry into the Internet. Traffic may be repeated more than once, from one pole top to another, to reach the WAP, if needed. The outbound traffic is broadcast on 2.3 Ghz pretty much straight out to the poletops that then relay to your wireless modem.

The handheld modems are operating at 902 -928 Mhz. The pole tops operate at 902-928, 2.4-2.483 Ghz and also in the 2.3 Ghz allocation.

You can learn more at http://www.ricochet.net

Greetings,
Looks like eBay slammed me and cancelled my auction. Their loss!! I wonder if they know that all the other scanners being auctioned off can monitor cordless phones, baby crib monitors, and so on. Any one interested in a full 800MHz coverage Pro-2006 in great shape? If so, email me directly. I'm willing to sell at a reasonable price and save the eBay charges on top of it.

My Goodness loony!....remember, even though you're a little reservist attached to the Naval and Marine Corps Reserve Center of 6735 N. Basin Avenue, Portland, OR. 97217-3993,.....

You're still obligated to carry yourself in a professional manner and treat all naval personnel, whether they be active or retired with the respect appropriate to their rank, (be they active or retired). Failure to do so

could result in disciplinary action in accordance with the Uniform Military Code of Justice. Specifically, "conduct unbecoming of sailor" comes to mind....

If you require guidance on appropriate behaviour of reservist program participant, I suggest contacting your senior commanding officers and chiefs listed below. (I've included their phone numbers for your convenience.)

(503) 285-4566, When prompted you can enter the extension number or press # 2 and type the FIRST 4 letters of the last name of the person that you want to talk to and the system well transfer your call to the proper extension.

Commanding Officer, Capt. P. A. Anderson, extension 510
Executive Officer, LCDR P. A. Sharp, extension 511
Command Chief, YNC J. E. Smith, extension 533

(If you want,..... I can forward your posts to the Command Chief, and then he can come looking for *you* to address your concerns. I'm committed to making this as easy as possible for you.)

You're welcome...

You friggin' loon.

:>having recently issued a rule against mobile operating.
:
:They tried, but I don't think they succeeded.

It is hard to ban technology. Whether it is abortion, radios or guns.

:>Are these connected? Has the possession / use of mobile radio equipment
:>been targeted for repression, in a similar manner as the possession of
:>firearms?
:
:Maybe not. I don't tend to make conspiracy theories when simple
:stupidity and ignorance are perfectly acceptable explanations. The
:fact is that today radios have been packaged so nicely that people
:don't remember what a two way radio looks like, works like, sounds
:like or even why it's there. They vaguely remember CB radio as a
:bunch of outlaw users.
:
:So now they see some dude sporting some truck or car with enough
:antennas sprouting off of it to make people think of porcupines. And
:what happens next?

The problem is that it is the well educated that are the most paranoid
about technology. I think that, as an anti '70s reaction, they want
to have a change to get a handle on technology. Things are going to
fast so they are want a chance to take a deep breath. That is why we
are seeing a reaction to all types of innovation to include guns,
Microsoft and radios.

:>I don't like the trend I've been seeing in the U. S. The place is
:>rapidly becoming less and less "free". Liberties I have taken for
:>granted all my life are being chipped away, state by state.
:
:Yes, and what allows liberties to be chipped away? IGNORANCE!

That is what scares my colonel (LTC, MI). there is so much paranoia.

:>I suppose the problem is that the possession of mobile radio equipment
:>(like the possession of firearms) gives a person some "power" of which
:>the government is afraid. It is indeed unfortunate that the people are
:>now so feared and mistrusted by their own government.
:
:People who really know how to manipulate a technology, any technology,
:are considered dangerous by the rest of society who can't. This is
:not new. The only solution is to produce so much technology that the
:rest of the world is trying very hard to understand and keep current
:with what's going on.
:

Cross-posted to:
alt.radio.scanner,alt.radio.scanner.uk,aus.radio.scanner,de.alt.radio-scanner,nl.radio.amateur,nl.radio.scanners,rec.radio.scanner

Hi,

Version 1.15 of ARC2 software for Icom R2 is finished and now available for
download at our website.

Some new options:

- V1.15 will correctly support frequencies up to 1599 MHz and makes it
easier to program the new 8.33 kHz step in the Airband.
- Table tags are now saved in the data file
- faster data upload
- you can select if you want leading zero's or not
- better 9 kHz for non US R2's
- you can select if you want to apply the bandplan automatically or not
- updated helpfile
- offsets above 99 MHz are now correctly supported.

Regards,

Gommert

In the particular case of "radio" bans, the money trail leads back to the Cellular/PCS mobile telephone industry. Where do they get their money?

From people ON THESE FORUMS who pay fees for cellular and PCS phones and pagers. If you want the industry to stop paying Congress to take away your rights and privileges, STOP PAYING FOR MOBILE PHONE AND PAGER SERVICE! Quit using the damned things! YOU ARE PAYING FOR THE EROSION OF YOUR OWN RIGHTS. Boycott them.

I will not use a cell phone or pager until Congress stops accepting money from the industry. That may not ever happen, but I can outwait them. I don't NEED a cellular phone or pager.

What a worthless commercial, good thing for you it didn't cost any money. Nothing about the product is mentioned, and everyone reading this knows as much as he did before reading it.

Next time, WAIT until "tomorrow" or whenever you KNOW what your offer is, and THEN you can tell what it is, without having to send someone someplace else to read it!

And to be safe, don't mention anything about it here, no one likes spam. If you have any offer that is good, word of mouth will take over. If you have to advertise it everywhere, it can't be such a great offer!

Get a Ham license, then you don't need "police permission" or "permits" and it is good no matter what state or state law you are dealing with as Federal law overrules any state laws.

For extra security, get the ham plates for your car, and carry your license with you, as well as copies of the laws that protect you to show to the dumb uneducated officers that pull you over.

Platteville played Stout yesterday. The result was Stout 43 and Platteville 35.

It is really nice out here this weekend. The leaves on the trees are starting to turn color and fall to the ground. It has been very mild to warm for temperature. We went to watch Stanford University play USC. We had to leave at the half because my son had his last baseball game of the season to play, but I listened to the game on the radio. Stanford won with a pass into the end zone with 4 seconds left on the clock. Maybe one of their best games they ever played.

To answer your question about cold weather I would really be happy to never have to own a snow shovel again.

John

Thank-you...The WI command works. In the PRO-2052 manual, it's not listed
and on the UNIDEN site, I overlooked it because it said "WI read the window
voltage"

I have another for you!

In the Service Scan mode, I can step thru the services PUB POLICE FIRE/EMG
AIR, and WX.
Is there a command to find out which service is selected.

Thanks again

Or you could get a professional license. (General Class Radiotelephone
License) Either case will require one hell of a lot of money, time, and
good lawyers to get that individual case decided by the U.S. Supreme Court.
In the mean time, every ones freedom of speech, and press rights will be
compromised. The Government argument will of course be that it is a matter
of public safety to drive while one uses the radio. (Of course, Police
officers, being superhuman, can use the radio while driving, and even a
computer, thus should be exempt from this law.)

I am not aware of a command to do this directly. It is possible to store a table containing all service search frequencies and do a lookup/compare to determine what service is being searched. The MD command will indicate when service search is active and the WI command returns the frequency. I do have a full list of service search frequencies if you want to pursue this. The list is for the BC245 which may or may not be the same as the PRO-2052 list. Using the RF command it is possible to command the radio to search any preprogrammed set of frequencies but the speed is probably much slower than using the native search feature in the radio.

Asking for patient knowledgeable individual(s) to familiarize me with scanning.

Recently purchased a BearCat 245XLT, which was probably jumping in way over my head for my 1st scanner. Anyway, I've got it now, and I better figure it out soon or I'll never hear the end of it from the ol' lady!

So far, I've downloaded SmartScan, and loaded frequencies, trunking talk-groups, etc from the Uniden Database. (as per page 62 of the Operating Guide)

I've read pages 14 thru 18 of the guide repeatedly in conjunction with the 'Betty Bearcat Starter' Frequency Guide. Still all I've gotten besides static, is the Weather Service, and what sounds like a Taxi service... And Oh yeah, my wife talking on the cordless phone to her mother (yippie).

I have several problems that I have noticed lately. When I spoke with
the State Police about the guy up in Elkhart, they mentioned that they
did not like the public "spying" on them. They also felt that there
were too many in our society who were constantly pushing the limits:
ie the gays, drug users, ACLU....

Then last year I showed some guys in my army unit, who were signal intelligence analysts (they do what scanner hobbyist do), how I could use my old ICOM W-2A to listen to cell phones. They went ballistic!! Absolutely paranoid. Some even called me a militia member. And these guys are suppose to know how to do this (I have more skill). My colonel can't understand their paranoia.

Second, at work I tapped into the frequency for the mainlander personnel (we rent the facility). The foreman found out, bitched at my boss that I had pirated (how can you do that if you do not transmit?) the frequency. My boss was so angry that he was shaking!! I tried to explain the law but he did not want to hear it. It makes me wonder if there is something going on that might be illegal that they do not want to be heard. And they did not understand their license was a matter of public record. Or that anyone with a freqency counter can find the freqency.

Something has happened over the last 5 years. More people are using radios, to include cell phones, They do not understand the technology, are a little scared of it, and want to use it like they do a phone. And they are paranoid to think that anyone can listen to them.

Where's the support for the BC245? There are many more of them in the
field than 2052's.

I'm sure there are many of us that would be willing to help. Only problem is that your question is a bit broad. Why don't you start with where you are so a local might chime in with all the info you need. Then, tell us what you're trying to monitor (local PD, Fire, etc.). Maybe based on that information and anything else you can tell us about what you've learned so far, we can help you out. Without anything to go on, it's a little difficult to assist you.

There is something like that here in Huntington Beach, CA. The boxes are on the arm of the street lights like yours but much smaller, probably 6 x 6 in. I first noticed them about 5 years ago. There is only one on a block (1/2 mile). The neighboring boxes are on the opposite side of the street. They are usually placed in the middle of the block.

1279. Wintone warning

Newsgroup: rec.radio.scanner
Date: 2000-10-23 00:00:00 UTC
From: neep.neep@acme.com
Message-ID: <0a48vs86km9ks6h6q686ph1gogvmkbreai@4ax.com>
Source record: 77290

After finding two serious bugs in Wintone over a year ago, I sent the
support folks this message. They admitted that the bugs were there
and promised a new version "real soon now." Needless to say there
was no new version.

Save your money and buy something else!

73,
Jim N2VNO
ZZZjim_cronin@juno.comZZZ (remove the ZZZ's to reply)

-------- The original message -------------
I purchased WinTone 2.02 to monitor a local repeater. There
are two bugs that prevent me from using WinTone:

When using "monitoring" to record activity the file size grows. When
it reaches 7008 K bytes (at 14 minutes 57 seconds of audio) six
popup windows appear, each with the text:
"Out of memory while expanding memory stream."

Since there is more than 15 minutes of activity in a day this is a
problem and makes WinTone unuseable.

The second thing occurs when turning monitoring on, then off, then
on. A popup appears with the text:
"You attempted to call StartRecordFile Recursively!"
WinTone then exits. This is a less serious problem than the first.

My configuration is an AMD K6/233 with 160 meg of memory. When the
errors occur the system monitor shows over 100 meg of free memory.
I tried both the generic .dll file and the pentium .dll;
both behaved the same. I have active tone detection set for
extended DTMF.

Can you help out with this? WinTone is a great piece of software
except for these two problems.
Please let me know as soon as possible if you do not intend on
releasing a fixed version.

The horror stories are probably just that stories. Canada customs could
care less about radios. They will ask you if you are bring anything into to
the country that you are not bring back. Be sure you have the proper
fishing licences or you will loose your car, boat and any other gear, if
you are caught.

Enjoy the fishing and welcome.

Just thought of something... if you happened to have a portable (handheld) transmitter that operated on the LoJack frequency, you could conceivably jam the LoJack receiver while stealing a car, keeping the LoJack signal from disabling it. Simply keep a 5 watt or so transmitter on while in the car, and the much weaker LoJack signal won't be heard by the receiver in the car.

Not that I'd ever do that, but conceivably it could be done.

"Richard McCollum" <rmccoll@radiks.net> said :

Richard, I can't let some of this go without commenting. I am not a lawyer (nor do I play one on TV), but I am a Canadian, currently living in the united States (NYC), who has crossed the US-Canada border probably 500 times in my life. I promise you, this is NOT an exaggeration.

> Two things you should do before going into Canada.

>1. Get a Canadian certificate from your car insurance agent. Do not need it
>to get in but it makes handling a thud-crunch all kinds easier. Remember
>you are in foreign jurisdiction and they tend not to let you or your car out
>unless there is money backing you. We do the same to them.

Nonsense. This is VERY true about going into Mexico, but totally false about going into Canada, or a Canadian going into the United States. You *do* need to carry proof of insurance (3rd party liability and whatever else _your state_ requires you to carry).

In Canada *YOU CANNOT BE ARRESTED* for a highway traffic offense other than DWI or dangerous driving. If you were to, say, run a red light and hit another vehicle in Ontario, you would get a ticket for the light and your insurance would handle the property damage to the other vehicle. You can only be arrested for a Criminal Code offense--and that applies right across Canada. We have one crimial code for the enitre country, and it's only for violating it that you can be detained in custody. Therefore there is no need to worry about not being allowed out of the country, etc. I repeat, this is NOT the case in Mexico where you most certainly need supplemental insurance.
>
>2. Be prepared to prove your right to enter the US, at the very least a
>birth certificate and a picture ID. Old passports work too. For very good
>reason, US border agents tend to get pissy without documentation.

Can't speak for an American re-entering the US, but to enter Canada you need some form of proof of citizenship and preferably a current piece of photo-ID. A birth certificate alone will work, but they might get pissy if you can't back it up with a current drivers license or other photo-ID. Obviously, they'd prefer a passport, but it's not required. I suspect the INS/Customs ont he way back will need the same documentation. Don't know about old, expired passports, however.

>With respect to your radio equipment, it is a problem in two parts. First
>is compliance with Canadian radio regs, the other is resale and duty
>collection. You may have to post a returnable bond for the latter which you

>get back when you leave.

Having radio equipment up the ying-yang in all my vehicles never
presented a problem crossing either way. I don't even think most
Industry Canada inspectors (Canadian equivalent of the FCC) know what
type-acceptance of equipment means any more, let alone the college-kid
you're going to meet at the border crossing. They're interested in
booze, smokes, dope and guns. If you don't raise a red flag on any of
these items, nobody will say boo to you. CB and HAM equipment are
basically exempt from any import regulations as far as I know.

>1. Haven't got a clue on Canadian scanner regs.
Ain't none. Period. Listen to what you want, where and when you want,
BUT as in the U.S., you may not make use of or divulge what you hear.
Even that's ignored by the courts (tow truck drivers and new reporters
have set jurisprudence. I was a news photographer for 6 years in
Toronto).

>2. Legal CB stuff should not present a problem.
Correct.

>3. There has been a posting that Canadian rules require an amateur license
>to own amateur gear. I can't verify it but your friend with the converted
>ham gear may have a problem on several counts.
Technically and legally that's correct, but again, when you cross,
you'll be inspected by a young kid, in all liklihood, who just wants to
know if you have any guns with you, and if you're bringing in more than
1 litre of booze or a carton of smokes. Ground crossings are extremely
lax.

>Depending on where you are going, some provinces come down like bricks on
>Yanks who violate their fishing regs. RTFM!
Absolutely. Not a fisherman myself (any more), but the Environment
Ministry in Ontario (game wardens) get *REALLY* upset if your I's aren't
dotted and T's crossed. Go to the Web site of the province you'll be
visiting and you should find everything you need. If you're going to
Ontario, you can monitor the Environment Ministry wardens in the 46 MHz
band (simplex).

>Probably not a bad idea to
>obtain some Canadian currency beforehand (to buy gas at 9PM) and to know the
>going rate of exchange.
Yes, absolutely. Your American banking card will work in just about
every ATM in Canada, your VISA/MasterCard is accepted almost everywhere,
but to my knowledge, Discover isn't accepted at all in Canada. Leave it
home. I also don't think that you'll find many merchants or individuals
in Canada who won't take American cash at a reasonable premium. Figure
that $100 US Dollars will buy you somewhere between $135 and $145
Canadian.

>You will also get to make use of the klick scale on
>your speedo.

Makes the trip seem faster, somehow <g>.

1287. FS or FT: Modified Sangean 909 with Kiwa Filters

Newsgroup: rec.radio.scanner
Date: 2000-10-23 00:00:00 UTC
From: Dan Schopp <dschopp@sprintmail.com>
Message-ID: <39F45A9D.E99587E7@sprintmail.com>
Source record: 77298
Cross-posted to: rec.radio.shortwave,rec.radio.swap,rec.radio.scanner

Why pay $200 or more for a Sangean 909 or Radio Shack DX 398 when you can have a modified Sangean 909 with both Kiwa wide and and narrow filters installed for $250.

This 909 is the 25th anniversary edition in the silver case. It was purchased from the CCrane Co and the anti chuffing mod and tuning knob mod were done by the CCrane Co. Here is the information, about the mods from the CCrane web site:

" Sangean ATS 909 Deluxe. This is the standard ATS909 with a professional twist. We modify the tuning knob for fast tuning and a smooth engineered feel. We also eliminate muting while tuning. between powerful stations. This allows you to locate hard to find weak stations."

Also the stock wide and narrow filters have been replaced with the Kiwa wide and narrow filters. Installation was done by Kiwa.

The radio is in excellent shape, comes with reel antenna, AC adapter, manual, and original box.

Asking $250 which includes shipping priority mail in the US. Or will trade for Sony 2010 in excellent shape with Kiwa wide filter installed or Radio Shack Pro 2042 base scanner.

Thanks,

D. Schopp

>Not that I'd ever do that, but conceivably it could be done.

Yeah, BUT, all they'd have to do when they find the problem is to DF
your transmitter. Now, you could really screw them by placing two
carriers on 3rd order IMD from LOJack's frequency and ensure there is
enough power from that to cause the LOJack receiver to block out any
activation request. It would be a while before anyone thought to look
for the Third order IMD products.

(just a dirty little mind working on useless drivel that nobody would
ever use)

But to do that, they'd have to know you were jamming it in the first place. From what I understand, LoJack operates by having someone punch in a code for the particular stolen veh, and the transmitter sends it out much like a paging transmitter would, and once the proper code is received the car stalls & can't be started again.

If you were blocking the signal, the receiver in the vehicle couldn't receive the code. But I doubt that the LoJack operator or the police would have a clue that you were doing that.

> (just a dirty little mind working on useless drivel that nobody would
> ever use)

That's what makes discussion great. Lots of "what if" information. It's fun to speculate. But in the back of my mind I am a little frightened that some criminal somewhere may read this and put it into practice. On the other hand, it would be much simpler to locate & disable the LoJack device.

Two things:
1) Milk costs more than gasoline.
2) Driving is a right, not just a privilege.

(in the USA anyway)

An obscure amendment, passed before the Constitution was ratified. The second half of it goes something like this. The travel shall not be infringed. Some people say that it doesn't preclude licensing and registration of car owners, and others say it is sets out a States right to have cars for official purposes.

>these guys are suppose to know how to do this (I have more skill).
>My colonel can't understand their paranoia.

Neither can I. I'm new to scanning (just got my first rig a few weeks ago) -- but hey, if people don't want us to listen, they should stop broadcasting (or use encryption).

I have no particular desire to listen to people's cellphone calls -- but as far as I'm concerned, if someone's beaming an electromagnetic signal through my body, they've got no business complaining if I figure out a way to listen to it.

My wife and I use 49MHz two-way radios when we're riding our motorcycles -- and it always cracks me up when we hear someone's cordless phone call while riding down the street. Since I got hip to how insecure cordless phones are, I've become a lot more careful about what I say on the thing, believe me -- in particular, if I'm doing a transaction that reveals personal info (e.g., calling a credit-card company's customer service line), I always use a phone with a cord.

But the bottom line is, if people are so upset that we're listening, they should stop talking. (Obviously, I'm preaching to the choir, in this crowd.) As for the cops, they're public servants -- we're the ones who pay their salaries, not the other way around!

Yes, but it doesn't say that you have a right to own a car or endanger other people's lives on the highway, and cars are by no means a necessity of life. There are always bicycles, mass transportation, horses (don't laugh - I used to ride mine to work and turn her loose in the field out back until my shift was over), carpooling (including hitchhiking which is ad-lib carpooling and highly encouraged in some countries with hitchhikers receiving coupons to give to motorists who give them rides), and the good old-fashioned method that everyone seems to have forgotten - walking.

Although many teenagers might argue that it is their right, vehicle ownership is a priviledge earned by those who work hard enough to afford one, and driving is a priviledge earned by those who do not drive so dangerously as to kill others.

In other words, even taking someone's license away for DUI does not take away their right to travel.

Your argument leads one to believe that freedom of the press covers
only newspapers using hot lead type.

Vehicle ownership is a right, just like ownership of anything else.
The question here is somewhat different, that being- the right to
drive YOUR car on public highways. Many believe that it is a right,
not a privilege. FIRST CLUE: Note that the state REPEATEDLY reminds
you it's not a right. :>

However, this is not a discussion I wish to continue, particularly since this is cross posted to groups that would probably rather not read about it. Therefore, I leave you with these links if you want to learn more.

The R-10 supports the 0x15, 0x01 CI-V command which returns
the squelch status. Be sure to give the scanner time to lock on
to the frequency before testing the status or you will get false
readings.

Command: FE FE 52 E0 15 01 FD
Response: FE FE 52 E0 15 01 00 FD (Squelch Closed)
FE FE 52 E0 15 01 01 FD (Squelch Open)

The problem isn't/wasn't excess freedom; it's insufficient
responsibility. The *only* solution is to teach responsibility;
however people keep looking for a quicker, easier "fix" via
legislation.

OK Guys and Gals,

What about the subject line in question..........

I am also interested in what frequencies they would use.........

With the present flitting around the country by at least two major candidates, it would be interesting to hear what is happening.

Any ideas? Please post your ideas or knowledge as the case may be.

We have that here in Long Islands north shore
Its a good idea only for this reason:
With new equipment, calling plans, cellular carriers merging hundreds of minutes are becoming very cheap.
To many house wives are driving these 5000 pound sport utilities and killing people wile yapping all day.
that goes for the likely husband attorney/broker jerk in the BMW.(around here anyway)

Its bad enough most woman cant drive for s*it then add give'em a 2 plus ton SUV's, a stereo, screaming kids and hundreds of minutes of cell phone.............. = death
I am on the road during the day, I have already been T-boned by some housewife not paying attention wile yapping.
I see it all the time and had to many close calls

Scanmaster Tunable Notch Filter SNF170

This Scanmaster Tunable Notch Filter is in brand new condition (opened but has had very little use). It will work well on any base, mobile, or handheld scanner and will knock out pager interference or FM transitter interference.

-Tunable Notch Range 85-175MHz
-Notch Approx.30dB -70dB ATT.Below 1.7MHz
-Impedance 50 ohm
-Insertion Loss <1.5dB
-Connector type Standard BNC type

I own a car with a LoJack system on it. If the car is stolen I have to call
LoJack and have them turn the transmitter on. There is no way it can sense if
the car is stolen. They did give me a code that I have to give them if it
stolen.

Yes your absolutely correct. On the other hand, talking on the cell phone while driving is no more dangerous than:

1. putting on your makeup, 2. adjusting your am/fm radio, 3. playing with your scanner, 4. drinking your coffee, and a host of other items we could post. Are you getting the idea?

One damn freedom taken after another in the greatest country on earth. Next we will be forbidden to pass gas while driving.

Did you read the article? This is a cell phone restriction not a ban.
This concept is becoming pretty common in many cities due to distracted
drivers. A simple hands free attachment takes care of most of the
problem and would be leagal under this proposed law.

That's specifically why I didn't buy a Lojack system. It takes intervention
from
me to stop a thief that ALREADY has my car. A little too late. They did
advertise they would refund the cost of the Lojack system but when I asked
about them paying the insurance deductible if it is damaged or not
recovered,
they laughed. I kept my money.

I used to work for an alarm company. Here's an easy way to prevent even a
pro from driving your car away (still can tow it of course). Many cars have
a impact sensor that kills the fuel pump. Find the wiring to this sensor,
cut it,
add your own switch inline. Make it hidden, wrap the wires to look as if
the factory installed the harness, don't tell people about it (many thieves
have
inside knowledge), and use it religiously. You can also do this with the
fuel
pump wiring, the clutch switch on a standard transmission or the
park/neutral
switch on an automatic. Total cost: $5. Better than ANY factory or
aftermarket
alarm. You install it, only you know about it. There are websites online
that
show you the wiring diagram for many major aftermarket alarm systems. There
are no diagrams to my systems. Other alarm tips... put a siren under the
car
where it can't be reached without jacking the car. Use a backup battery
system. Within 10 seconds, a thief can silence most alarms. 1 guy breaks
the side window with a center punch and pops the hood, the second guy opens
the hood and rips out the siren. You should also add a second siren inside

your car. Tough to work inside a car with a 115 db siren wailing in your ear!

What's this got to do with scanning, nada. :-) But it may help someone keep their vehicle so they can afford the BC780XLT when it comes out (oh, a scanning reference, I pulled it off).

Warning: stealing my vehicles may result in severe lead poisoning.

Robert

Agreed. Something that happens here which may not (or may) help, is that some
people who 'do' use a cell phone while driving, drive extremely slooooowww.
Like Greg mentioned (next post) - a headset often does the job for me, as well.

No wonder you're anonymous and don't want your posting archived -- you
are wrong!

When a LoJack-equipped car is stolen, NOTHING SPECIAL HAPPENS.

When a LoJack-equipped car is reported stolen, the law enforcement
agency (if advised the vehicle had LoJack...) sends a message over their
data network to an operations center, which will then cause the
broadcast of a signal from base stations in the region on 173.075MHz,
with a specific address to activate the LoJack transmitter in the stolen
vehicle. If/when the LoJack unit receives that signal & activates, it
sends a chirp out every couple of seconds (about every 5 seconds, if I
recall right) on 173.075. That chirp includes a 4 or 5 character
alphanumeric code, which will show up on the receivers of nearby
LoJack-receiver equipped law enforcement vehicles.

The PD will then run that LoJack identifier through a database, and
determine the make, model, etc. of the vehicle that unique LoJack
transponder is registered to, and the officers will then try to home-in
on the signal, using the clock-style indicator that shows the direction
of the signal relative to the receiver, and also has a signal strength
indicator.

> others.

While the government might argue otherwise, I certainly feel that a person has a right to drive an automobile. I base that on the notion that free travel, without government restriction, is a natural right of every citizen in this country. And, since the automobile has become the main means of travel in this country today, that right of free travel also extends to the use of an automobile.

Now, just as the right to own a gun can be taken away from a criminal, certainly the right to drive a vehicle can also be taken away under some circumstances (DUI, reckless driving, etc). But that does not change the fact that it is a right to drive a vehicle.

And, just like gun ownership, the government can regulate use of that vehicle (driver's license, speed limits, etc). But again, that regulation does not change the fact that it is a right to drive a vehicle.

What the right to drive a vehicle means is that the government cannot unfairly, and without just cause, restrict a person's freedom to use a vehicle (their property).

In other words, it is not a "priviledge" to use your property to travel freely in this country - it is a right. And that includes teenagers old enough to drive safely.

Yes true. However most normal radio ops plop down on one frequency
and don't need to look at the rig. Cell users have to look at the
phone when dialing, even if only to hit one button.

EEsh!!!

For starters, anyone using a cell phone, or transmitter should be smart enough to use the general "common sense" rule... Dont say anything on it that you wouldnt tell your mother. Anyone lacking "that" information NEEDS to be listened to!!

Police...???
Egads!!! Where would we be without them?? On the other hand.. Were are they getting some of these (few) idots?? It's a "RIGHT"! to bear arms, it's a frigin RIGHT! yet they will do their best to intimidate you if you have one in your possession.
While Im at it, Hats off to Officer Hornbuckle of Renton. This guy is great! Knows our kids and does a heck of alot to keep them out of serious trouble!

Silly public... Driving is just a privledge but yet more folks "get excited" over prices of fuel than losing their basic rights... Go figure!

Two things you should do before going into Canada.

1. Get a Canadian certificate from your car insurance agent. Do not need it to get in but it makes handling a thud-crunch all kinds easier. Remember you are in foreign jurisdiction and they tend not to let you or your car out unless there is money backing you. We do the same to them.

2. Be prepared to prove your right to enter the US, at the very least a birth certificate and a picture ID. Old passports work too. For very good reason, US border agents tend to get pissy without documentation.

With respect to your radio equipment, it is a problem in two parts. First is compliance with Canadian radio regs, the other is resale and duty collection. You may have to post a returnable bond for the latter which you get back when you leave.

1. Haven't got a clue on Canadian scanner regs.

2. Legal CB stuff should not present a problem.

3. There has been a posting that Canadian rules require an amateur license to own amateur gear. I can't verify it but your friend with the converted ham gear may have a problem on several counts.

Depending on where you are going, some provinces come down like bricks on Yanks who violate their fishing regs. RTFM! Probably not a bad idea to obtain some Canadian currency beforehand (to buy gas at 9PM) and to know the going rate of exchange. You will also get to make use of the klick scale on your speedo.

Great fishing though. Ever thought about just leaving the radio gear at home???

Well, radio RECEIVERS have been made illegal in some states and in some areas already. In those places, it is illegal to possess a device capable of receiving certain radar signals. I'm not sure, but I *think* certain scanners capable of receiving police frequencies may be illegal too.

I have an old Regency crystal scanner with the model number ACT R10 H/L/U on the back. I have a question about this... there are two jacks on the back, one for a VHF antenna and one for a UHF antenna. They appear to be motorola type jacks, but a standard motorola adapter doesn't fit - it's too big at the end.. does anyone know what type of jack goes in here and where I can get one? I'd like to hook this up to my outside antenna. I currently have my trunk tracker and Midland receiver hooked up to it...

Please reply in EMAIL. Thanks!

Because the government, at all levels, applies contract law while
you talk of common law as in the Constitution.

>
> Now, just as the right to own a gun can be taken away from a criminal,

SCOTUS has several times cited the right to travel the public
roads as a right.

>
> What the right to drive a vehicle means is that the government cannot
> unfairly, and without just cause, restrict a person's freedom to use a
> vehicle (their property).

Just cause and "due process". A jury of peers must apply a criminal
sanction in order to imprison which is the only Constitutional
way to effect the right to travel.

>
> In other words, it is not a "priviledge" to use your property to
> travel freely in this country - it is a right. And that includes
> teenagers old enough to drive safely.

The States, since 1934, have claimed that this is a privilege
in order to convert the natural right to fiat law. The same
was done with titles of ownership as with the automobile (certificate
of title) and property (warranty deed). When you register your car
or your land, you give title to the state which then places you
under statutory control.

The same is true of a marriage license and the drivers license.

Your birth was "certified" by the Department of Commerce,
hence the birth certificate.

I can't believe some of these answers. Canada customs could careless about radios or scanners ask any trucker. Canada customs is not going to ask to see a ham license, neither are the police.The police could less about radios/scanners. Industry Canada does not enforce the regs. unless some complains very loudly for a very long time. Don't worry about your radios.

Dwight which province does not allow portable scanners? Now if you break the rules fishing or hunting you are walking home.

That wasn't part of the question that was asked and answered. A law that enhances a criminal charge due to coincident possession of a radio is NOT a prohibition on possession or use of the radio.

However, I did misspeak when I mentioned motor vehicles as the sole exception. There are some communities (Rochester, NY is one) where PORTABLE use of a police (or fire in Rochester) receiver violates a local ordinance.

Manitoba has a law that prohibits the use of scanners in a motor
vehicle. There may be exceptions to this, but the law does apply to
the 'average' person. You may be right about Industry Canada's failure
to enforce regs, but this is a provincial law, so federal bodies (with
the exception of R.C.M.P) typically would not enforce it anyway.

You're probably also correct in stating that no action is usually taken
unless there is a complaint. I only know of one case where equipment
was confiscated, but the circumstances surrounding the incident lead me
to believe that the person had actually drawn attention to his
activities in a rather negative way.

I think that we view hte definition of "right" differently. I believe that driving is a priviledge, granted by society to people who have demonstrated adequate skill and knowledge to safely handle a motor vehicle. As a priviledge, it can be revoked at any time for a variety of reasons, ranging from criminal behavior to national defense (remember gas coupons and blackout lights on headlights?). To me it is the same as the ham license that we earned that gave us the priviledge (not the right) of using certain specified amateur radio bands. At the time it was written, horseback was the most common mode of travel, so I'd say that was what they were aiming at. If we were to use the most common mode as a factor, I'd say that everyone else has better cars/trucks than I do, therefor I have the right to a better car. Bottom line is that The Constitution does not say that you have the right to drive anything....whether a faster horse than your neighbor's, a buckboard, stagecoach, or a shiny new SUV. All it says is that you have the right to go.

Besides, if driving was a right, don't you think you'd be able to get cars at the welfare office? Or are we depriving them of their right? Also, since flying is the more common means of transportation over distances, does that mean that the airlines can no longer deny service based on a lack of cash or innappropriate behavior (drunk and abusive)? If so, look out Hawaii, cause here I come! It's my right, and we all know that we cannot legally be denied rights based on socioeconomic status.

I'd do a search from 850Mhz to 950Mhz (closer to 850Mhz). That's where they
are in Colorado.

OK, then, I'm thinking of a completely different system. I don't know if
this is in widespread use or not, but I saw on TV one night about a system
which, after being activated, shuts down the stolen vehicle which stops with
flashers blinking, and can't be started again until the unit is deactivated
somehow. This would be a good system except, as the program pointed out,
the thief was on the freeway when the unit activated & shut the vehicle
down.

Interestingly, just renewed my recently expired passport. While filling
in the form, the gal asked my why I was renewing it. I said it's simply
the most positive ID anyone can possess, besides it's my right as a US
citizen to have it. She said that the US government considers a passport
a "priviledge" not a "right" or a "luxury."

I guess I paid $40 for the "priviledge". Got it a week later.

"Sorry, you're not priviledged enough to leave the country, have you
been to Disneyworld?"

Well all I can tell you is how it works here in Mass.
If a car equipped with LoJack is entered into the Police's statewide computer network... Transmitters on The Blue Hills, Mt Wachussett and Mt Greylock transmit a coded signal on the LoJack freq. This is received by the unit and starts the unit transmitting its little data chirp. When a cruiser calls in that they are receiving a specific code and tracking it the chirp can be sped up by reentering the car or code in the computer system. If a signal that is not coded and received officers are trained to notify and immediately track it. When we did live broadcasts with people trying to win vehicles it was very common to have multiple departments all converging on the vehicles. When ever a unit comes on there are always several cars in the area which is why most cars are tracked in seconds or minutes.
Its basically a one frequency unit very similar to the units the FCC and Coast Guard have been using for years without the gps mapping option.
They even recovered one of my cars when it was stolen in 16 minutes from when it was reported. I wouldn't own a vehicle without it now.

I agree..... I cross into Canada regularly from Michigan via as many as 5 different entry points (ferries, bridges, and tunnel)... I have had as many as 5 antennas and 4 radios in the car (HF, VHF, UHF, 11m, & 2 HT's), all in plain sight..... I've never even been asked "...What's all the antenna's & radios for?"... even in an OPP (Ont. Prov. Police) stop.

Teletrac & probably GM's OnStar can do that type of thing. Also,
panic-switches on some car alarms will allow a car-jacker to drive off
for a minute or two (putting some distance between him/her & the victim)
& then shut the car down.

1368. Re: Lo-Jack

Newsgroup: rec.radio.scanner
Date: 2000-10-24 00:00:00 UTC
From: John Reed <jreed@NOSPAM.thor.atl.ga.us>
Message-ID: <svbvjs2ks5j036@corp.supernews.com>
Source record: 77184

John's post below is exactly how it works.

I used to dispatch police years ago....in more detail, it works like this:

You buy a car with Lojack on it. Some punk steals your car. Later, you report your car stolen, the police take a report. Then, the person back at the police department enters the car as being stolen on the police computer network (who's names differ on a state by state basis - in Georgia, it was called 'GCIC').

When the vehicle is entered as stolen, the VIN (lojack is keyed to the VIN!!!) is cross checked with the lojack database - and if there is a match, the transmitters fire up and send out a code that says "if you're this car, please start chirping every 5 seconds". (They key here is (a) the idiot dispatcher has to enter your VIN in correctly when they key in your stolen car into the computer, and (b) your car needs to be under the footprint of the lojack transmitters.

Now, after that, John Q. Policeman is driving around and he gets a hit on his lojack receiver - this has an alphanumeric readout - which will read the ID of the stolen vehicle. He will "run" the ID very much the same way he would run a license tag. If the dispatcher gets a "hit" on it, the lojack system then tells the stolen car to start transmitting almost continuously. (every second or something like that). The cops then have something easier to converge on and find it, now that the transmission is a little more constant.

We had test units we would play with and drive around town in it and see if cop would find us.

Lojack is only good if (a) your car is stolen in an area where the cops have lojack receivers - get that car 50miles outside of Atlanta and you don't have to worry too much about that ; and (b) your car has to be able to hear the lojack system transmitter site.

YOU have to report your car stolen first - but your car's lojack system won't even come alive until your car is entered as stolen (and entered properly) into the state crime computer system - with some agencies - the report may be taken at the early part of the shift, but it may be late in the shift before the policeman drops by dispatch to give over the necessary information to actually enter the car as being stolen.

The car doesn't "sense" its been stolen until it receives the "activate" signal from the lojack transmitters - until that time occurs, the would-be thieves could be miles away.

There are two answers to this. First, there is a new system that someone is pushing that "kills" the electronics in a car and thus could be used by the police to stop a car. Second, some alarm systems, Clifford being one, offer a system that is coupled with a cell phone - you find out your car is missing, dial a number and (eventually) the car shuts off. I say eventually as there is usually a set of parameters that must be met, i.e. the speed must be below 20mph for the car to shut off.

At all costs you need to avoid getting a DWF ticket. You roll down that
window the cop takes one wiff and you will get a tag for sure. You will
then have to get a lawyer and attend anti DWF classes.

As I see it, Marylou is just tired of the BS as the majority of the rest of us. I don't see her siding with any particular person.

I have to agree with her, get a life, grow up. This is worst than a school yard full of grade school children, even they know when to quit. I always thought this newsgroup was about the hobby of "scanners and related items".....

Actually, the scary thing is that they DO let blind people drive. I
have a close relative who used to work for the Mass. Commission for
the Blind -- she says there are people who are legally blind and can't
see a thing, but drive around anyway, looking through these
high-powered scopes that enable them to see juuuuust enough to get
around, provided there's plenty of light. Highly dangerous, but
perfectly legal.....

I'm new to scanning, but I'm very satisfied with the 245XLT I got a
few weeks ago. Very easy to program and use, even for a novice, and
it seems to do a good job pulling in signals from quite a few miles
away, even with the small antenna that comes with it. You can buy it
direct from Uniden for about $200.

Well your budget is going to eliminate the PRO-92, so the most logical
choice left (and possibly the best) would be the BC245-XLT.

I went to the Shack this past weekend (Oct.22) and they knew nothing about the 92 sale. Is this an internet hoax?

I have heard varying opions regarding the 92, 92a, and 92b. What's the true scoop? My local Shack has four 92's and they are all plain 92 models. Would I be tossing my money away?

Because that is what you have been told over and over again in school (the government)

> granted by society to people who have
> demonstrated adequate skill and knowledge to safely handle a motor
> vehicle.

What about before there WERE driver's licenses? Didn't know that there weren't always driver's licenses and people drove cars without them did you? Didn't need a permit for a gun either. Drugs such as cocaine and marijuana were not always illegal either, only in the last few decades. We went over a hundred years without an income tax too. When the government sneaks in new laws and taxes, people seem to forget the freedoms we once had before the government took them away from us. Remember the Boston Tea Party to protest the tax on tea? Well guess what? The US government put the tax back on tea and no one seems to question it.

Driving is a right, in the fact that you can not properly live and survive without driving, and that needing a license to drive was added later. Even though the government illegally requires you to have a permit to have a gun now (unlike before) it is still your right to own one.

> To me it is the same as
> the ham license that we earned that gave us the priviledge (not the
> right) of using certain specified amateur radio bands.

The airwaves belong to the citizens, and any citizen has the right to use any of the amateur radio bands, and again, there was no license needed in the beginning either, the government claims they need to test you to make sure you know how to use the power without causing interference and to understand what you are playing with, not to make it hard to get into a hobby like some silly hams think, or to "weed out" people or make it more exclusive.

> Bottom line is that The
> Constitution does not say that you have the right to drive
> anything...

It also doesn't say you have the right to breath air or eat food. You can't list everything, especially the OBVIOUS things. But on the Constitution, it was null and void the first time they changed it with an amendment. Try using your right to own and BEAR arms and see what happens to you. The Constitution no longer even holds up in a court room.

> Besides, if driving was a right, don't you think you'd be able to get
> cars at the welfare office?

Owning a gun is supposedly a right and they don't hand them out at the welfare office either. They give money which can be used to buy food, medicine, guns, and cars.

This whole "rights vs. privilege" thing is amusing and largely a bandying of semantics....

A "Right" under our system is generally considered to something conveyed to a citizen by the Bill of Rights. Most people like to throw around "Life, Liberty and the Pursuit of Happiness" as being a catch-all that basically entitles Joe Citizen to do whatever he wants to. This is not the case. We also have laws that are designed to regulate human behavior. This is where things like driving a car or using a scanner come in.

Driving a car is not a Right granted to a person by the Constitution. Driving is regulated by both state and Federal Law. This is done (theoretically) to ensure that motor vehicles are operated safely and that the appropriate taxes are paid to support the infrastructure that allows safe and orderly operation of motor vehicles. This is why we have fuel taxes, etc. You cannot say that your freedom of movement is being restricted because you can't drive a car. You are referring to your Liberty and your Liberty only goes away when you are arrested.

I sincerely hope that all you yahoos on here raving about this stuff put some of this misdirected energy to use and go vote this November. The whole reason most of these Draconian Laws are in place is that only 20% of the people bother to get off their dead worthless asses and go vote!

This kind of attitude is exactly why these laws work. If you want to use
the damned scanner and you don't agree with the law, then have some balls
and engage in the tried and true American tradition of Civil Disobedience.

True, we obviously do view the definition of "right" differently.
But, in the end, it is the government's definition that wins (they
control), and they agree with you that driving is a priviledge.

> Besides, if driving was a right, don't you
> think you'd be able to get cars at the
> welfare office? Or are we depriving them
> of their right? [snip]

Its not the government's job to supply a means to a right. For
example, the government does not have to provide printing presses to
insure the freedom of the press. A right just means that the government
is limited when it comes to taking that means to a right away. For
example, to seize the printing presses of a newspaper on political
grounds would be a violation of the right of a free press.

So, even if driving a car was a right, its not the government's job to
supply a car to the people - they're just limited when it come to taking
that car away.

But, all this is a minor point, since driving is a priviledge, not a right.

With a few exceptions, the Bill of Rights does not convey
rights; it respects and protects rights. In most cases, the
language in the BoR assumes that rights are pre-existing.
Amendment 9 spells this out.

> Most people like to throw around "Life,
>Liberty and the Pursuit of Happiness" as being a catch-all that basically

The people's rights are not restricted to those spelled in
the Constitution. See Amendment 9.

>Driving is regulated by both state and Federal Law.

This may or may not be Constitutional. The fact that it
happens now does not make it Constitutional.

> This is done
>(theoretically) to ensure that motor vehicles are operated safely and that

A very good argument can be made that the public roads are
government property, and so the use of them is controlled by
the owner- the government. Practically speaking, the
licensing and permitting processes are so liberal that they
are not an issue worth disputing.

>I sincerely hope that all you yahoos on here raving about this stuff put

You mean like back when cars went 30 MPH and there were only a few in each city? That was before they started hitting things (like innocent people) and it was decided that they needed to be regulated. Did you know that pilots didn't need license either? I suppose you think that flying is a right that should be unrestricted as well....if you can afford a surplus F-18 or KC-135, you can fly it where you want.

> them away from us. Remember the Boston Tea Party to protest the tax on tea?

They weren't protesting taxation, they were protesting taxation without representation. Read up on your history.

Funny...someone should have told me that I couldn't properly live and survive without a car before I let my ex take our car in return for not fighting me for custody. We rode our bikes for 2 years and were glad for the extra exercise and lack of bills that came with a car. When it comes down to it, a car is sometimes more of a pain in the ass than it's worth. Lot of people I know get along just fine without a car and are glad for the reduced stress of no payments or insurance.

If you think you need a car to survive, I sure as hell feel sorry for you if TSHTF. You think your right to drive is going to supersede a farmer's need for fuel to harvest his crop?

Can you imagine a control tower trying to talk over a bunch of yahoos who don't know what frequency they're on while trying to direct your plane in for a landing? How about some guy who got himself a big ol' linear, set it up with a groundplane outside his window, and now his neighbor can't figure out why her hair is falling out and her TV doesn't work?

I think that the right to breathe and eat comes somewhere under the right to life, liberty , pursuit of happines etc etc. If you don't believe me, try fasting for a few months or holding your breath for an hour or so and tell me how alive or happy you are.

And as far as i know, driving regs do not apply on private property....which is why most of us backwoods folks learn to drive before city kids learn to ride a bike.

The worst I can say about testing and all is that it is a joke. Here in FL, they hold the test on a closed range and they even eliminated parrallel parking, which used to be one of the best tests of car-handling abilities in tight quarters.

Actually, when I was growing up in OH, there was such a law.
A coworker of my mothers was legally blind so he couldn't
get a license to drive a car.

So he got a motorcycle license instead.

I've heard this radio referred to as "an Astro Saber in a MTS-2000
case." It supports the digital modulation (Astro or APCO 25) like an
Astro Saber, but looks more like an MTS-2000. I believe the XTS-3000s
will use some (but not all) of the MTS-2000 accessories.

Good thing you weren't too sure. There is no law anywhere in the USA that prohibits possession or use of police radio receivers, except in motor vehicles in some states. It can also be imposed as a condition of parole or probation after criminal conviction, depending on what the offense was.

Sounds like a Radio Shack crystal story to me! :-)

From the Lojack site.................
www.lojack.com/protect/m_protect.htm

"The LoJack Recovery System contains a small transmitter which is randomly hidden in your vehicle and is activated by a routine stolen vehicle police report. The LoJack signal can lead police directly to your vehicle within the LoJack network. "

The police activate it, Lo-Jack senses nothing. You could be possibly be confused by the option of alarms that can be installed along with the LoJack as a package but they are just car alarms and nothing more, the LoJack transmitter is triggered by the police. The LoJack does not sense a break in.

>problem and would be leagal under this proposed law.

This is a major misconception. A study was done and published in The
New England Journal of Medicine -- February 13, 1997 -- Vol. 336, No.
7.

http://www.nejm.org/content/1997/0336/0007/0453.asp

It found no difference between hands free and hand held phones. The
study showed that it was lack of concentration that caused the crash
and that the call had an effect up to 15 minutes after hanging up.
Some folk in the study didn't even remember they had been on a call
just before the crash.

Allowing hands free operation will have no effect on reduction of
accidents due to cell phone operation. Cell phone are but one of many
things that take one's concentration off the road including
discussions with passengers, getting involved in an interesting talk
show on the radio and such. The main reason cell phones were used in
the study was due to the ability to obtain accurate use times so they
could be compared with the time of the accident.

A surprising finding was the effect the call had on one's driving
after the call had ended. According to some "experts" you are told to
pull over to make the call. According to the study you should pull
over, make the call, then wait 15 minutes before driving. It's
strange that part is never mentioned. Makes me wonder if those making
the laws read all of the study or even read it at all.

Mike

scanners are ok, but portable scanner regs vary from province to province.

CB's are absolutely no problem, as longs as they are unmodified. The same with the Ham equipment, by treaty, a US HAM can operate his unit in Canada, have him look here to see if he is covered

http://www.rac.ca/faqgovt3.htm

If you want, I will post you a toll free number for canada customs and they will be more than happy to answer any questions.

Comments made in this thread about problems at customs and with fishing licenses should be noted. Especially the statement about making sure that you have proper papers to get back into the U.S.

The customs officers here are nowhere near as bad as they are made out most of the time, just be polite and honest, and don't think that because they don't have guns that they can't make your life miserable if you provoke them.

Proper fishing licences and adherence to quotas is important. Canadian law does permit the confiscation of vehicles, boats and tackle. Don't take this personally though, the same laws apply to Canadians.

All that said, come on up! We have the biggest meanest leader chewing, lure swallowing fish you will find anywhere. And the best beer to wash down your buddies fish tales with, once you are back at the dock. The only bad thing about coming up this time of the year is that you will miss out on our misquitoes, which make our fish look like minnows!!

I think that talking while driving is distracting enough (whether it's on a cell phone (with or w/o including headset) or not. I think the REAL problem is when you are making the call or picking up the call. With those little buttons, it's difficult to not take your eyes off the road to pick up the phone.

I think that you will find that most states probably have a code that
imposes a penalty for possesion of an operational 'scanner' capable of
receiving police frequencies during the commision of a crime. Remembering
that speeding is not covered under criminal codes.

However, use of a scanner to avoid spped traps does go a long way to
identifying why some jurisdictions do forbid there use in vehicles, just as
they do radar detectors.

> 7.

No, it's not a misconception, and the abstract says that it isn't. "P not
significant" just means that given the data they had they couldn't find a
correlation.

> http://www.nejm.org/content/1997/0336/0007/0453.asp
>
> It found no difference between hands free and hand held phones. The
> study showed that it was lack of concentration that caused the crash
> and that the call had an effect up to 15 minutes after hanging up.
> Some folk in the study didn't even remember they had been on a call
> just before the crash.

The abstract says nothing about the affect on concentration. It does
however, note that the degree of risk was still significant up to 15 minutes
after a call. As to the memory issue, please refer to a competant text on
the issue of the effects of psychological trauma on long term memory
transfer. Not to mention that the abstract doesn't mention this.

> Allowing hands free operation will have no effect on reduction of
> accidents due to cell phone operation.

Again, not significant, give us a quote from the complete article if you have it. what are the numbers i.e. how many of the 699 drivers studied were actually using hand free units?

> Cell phone are but one of many
> things that take one's concentration off the road including
> discussions with passengers, getting involved in an interesting talk
> show on the radio and such.

I don't see this anywhere in the abstract. All it concludes is that a person using a cell phone is 4 times more likely to get into an accident than someone who isn't. I have to assume that since none of these are included, they as well as other otherwise distracted drivers are still four times less likely to be in an accident than a person on a cell phone.

>The main reason cell phones were used in
> the study was due to the ability to obtain accurate use times so they
> could be compared with the time of the accident.

Hmm, a quantifiably accurate record of the correlation between the event and the proposed causal effect, now why would anybody want to base a scientific study on information like that?

> A surprising finding was the effect the call had on one's driving
> after the call had ended. According to some "experts" you are told to
> pull over to make the call.

which experts? I do know that the manual for my cell phone says to do this, but I have to also assume that the only expert that had any say in that clause was the one in their legal department who wanted to protect them from liability.

> According to the study you should pull
> over, make the call, then wait 15 minutes before driving. It's
> strange that part is never mentioned.

Yes it is strange, care to quote the section of the article that says this, the abstract doesn't.

>Makes me wonder if those making
> the laws read all of the study or even read it at all.

Did you?
I am confident that the actual study was very good, however, given the little information that I do have, I am also confident that should I contact the author he would be willing to admit that his study was not unequivocal proof that hands free units would not significantly reduce this risk. The only way to make that type of statement is if you have followed a statistically balanced set of three types of people:

group a - non cell users
group b - cell users - hand free all the time

group c - cell users - never use hands free

tweak for age, driving record, experience, and then we have something approaching a useful result.

The study that you have found isn't useful in the context of real life, but that's ok it wasn't supposed to be. But if he hadn't done this study, he would never get anyone to give him any money to do one like I mentioned above that would have some real life significance. That's the way the game is played.

According to the site, the system is activated by the police department
after a theft report is received, not by the vehicle "sensing" a break-in.

Which, if that was how it worked, would be totally useless in the instance
of a thief having the key.

The 780 received FCC approval in April. The delay has been while Uniden finishes up the firmware for the radio. Apparently they debugged the existing firmware and added some features. It's going to be a great radio when it comes out, well worth the wait. And, since it's only a little bit bigger than the 760XLT or the RELM MS-200, it will be great for mobile use.

1418. BC60XLT?

This scanner is not s hot, I have one,
Terrible audio, speaker rattling, Display light can not be set to stay on.
The only mod available is to bring it up to 60 or 90 channels.
I dont have it but seen it on the web.
I paid $25 for mine and know why.

Gene, you're being a little unrealistic. There are 9 million people who live in the Los Angeles area alone. And it is impossible for all of them to live within walking distance of their work. By the same token, it is impossible for all of the 260+ million people who live in this country to live within walking distance of their jobs. Without the automobile, our economy would collapse and millions would starve. In other words, the automobile has become a necessary means of transportation in this country - not an option that that can so easily dismissed.

PMJI (and it's probably a semantic thing as well), but is it not the case the the Constitution and BoR actually enumerate the limits of the federal government, rather than the freedoms of the people? I mean, the 2nd Amendment says in part, "the right ... shall not be infringed." To me, this is different than, "the people have the right to...". In the former, you're saying that "You (government) can't...", whereas in the latter you're saying, "You (people) can...". This is further strengthened by the 9th and 10th Amendments, as you've quoted.

Looked at from this perspective, both the Constitution and the BoR are not lists of rules for the people - they are rules for the government. So it doesn't matter whether a right is listed in the Constitution, because the Constitution doesn't limit the actions of the people...it limits the scope and power of the federal government (or is supposed to, anyway).

Just my $0.02 worth. Back to lurk mode.

THIS century nimbnutz, the 20th. The 21st doesn't start for a couple of months yet. Passports were not around at the start of the 20th century, some 1198 months ago.

That's why I like being back in school. I can debate with people who know
how.

We were talking about scanner bans way back when this thread got started.
Many offensive anti-scanner laws are sponsored by the cellular phone
industry association (CTIA - which now stands for Cellular Telephone AND
INTERNET Association - very scary). The way to combat CTIA purchase of laws
is to stop giving money to CTIA.

All of which has ABSOLUTELY NOTHING TO DO WITH ANYTHING YOU JUST SAID.

Hello

I was using Wacars with a Pro-37 and everything was fine.
But now i have wonderful Pro-2006 and Wacars does not work anymore :
Only a few percent of the messages are decoded.
Hearing the two scanners it seems that the Pro-37's output as quiet
more noise but is crisper. Is that the point ? Lower bandwith of the
2006 making voice easier to extract from noise but digital datas more
"fuzy" ?

I have seen a mod for the 2006's audio that is said to make the sound
crisper in WFM mode. Does it works for AM too ?

Sent via Deja.com http://www.deja.com/
Before you buy.

I can be outraged about any number of topics, but I can also stay on topic
for the forum of the moment.

Let's see, this message is being propagated to rec.RADIO.amateur.misc,
alt.RADIO.SCANNER,rec.RADIO.SCANNER,talk.politics.guns,misc.survivalism .

Hmm, OK, the thread is probably off topic for the last two, but where do the
building industry or anyone else fit into the above list?

-Dave, NF2G, etc.

Probably the best thing to do, if you can, is put up some sort of scanner antenna as high as possible, with as short of coax as possible. You don't say what sort of TV antenna you used, but it sounds like a set of rabbit ears. You might try extending each leg (or "ear") until you have one long length of antenna, with the cable connected in the middle. Turn this so it is vertical, and then put as high as you can. I wouldn't worry about impedance matching too much, since you won't have a perfect match over the broad range of frequencies you are probably scanning.

> longer even holds up in a court room.

Gentlemen, gentlemen, the Constitution does not give you any rights.
It doesn't have to, you already have them as *natural rights*.
That is why the Constitution is not loaded with all of the things you
can do. The purpose of the Constitution is to tell the federal
government what to do. The Bill of Rights tells the government some
of your rights that must be guaranteed.

The Constitution is an agreement of all the States to create a
central government to perform a few things that the States
could not do individually.

In short, under the Constitution, you can do anything that does
not infringe upon another person's rights.

This is the way it was until just after the turn of the century.
The big changes came with FDR. Most everything the federal
government does today is unconstitutional, but that's another
story.

The Constitution is still there but there are two law systems,
the Constitutional law system and contract law. Today most
everything falls under the contract law. Every time you
sign for a license or register to vote, register your
land or a hundred other now commonplace acts, you contract
with this second legal system.

Chance are, your grandparents had no birth certificates,
no income tax, no driver's license and no marriage license.
There were 90% fewer laws. Of course it was the grandparents
that allowed most of the unconstitutional crap to happen.
Today we're just beginning to see the results.

Some food for thought.

She was right. If you want a passport, you request a grant from the
government and agree to its conditions. As a natural citizen however,
you don't need a passport to leave the country. Of course all the
air and shipping lines are de facto government agencies and won't
cooperate with you but the fact remains, you don't have to have a
passport.

Just think, no one had a passport until this century.

1456. Maycom AR-108 Deletion possible!

Date: 2000-10-25 00:00:00 UTC
From: John de Giorgio <degiorgio@ilo.org>
Message-ID: <39F6CEF5.583009CC@ilo.org>
Source record: 77238

Although not documented, it is possible to delete unwanted channels on Maycom's tiny AR-108. I played around with the buttons and by pure luck fell upon the sequence.

1. with the squelch control turned right down, hold FUNC and press MR.
2. the MR and channel number will flash.
3. hold FUNC and SC and HOLD THEM BOTH DOWN for a few seconds.
4. the display will reset to "----------".

I'm sending you this message in case no one else has come up with the key combination.

John de Giorgio
Geneva, Switzerland.

Yes, but don't you choose where you work and live? These are your
decisions and I don't knock you for them. But noone forces you to make
them either. Besides gunner, I wouldn't worry about you personally. I'm
sure that if TSHTF and your fuel supply disappeared, you'd get along
just fine LOL.

I bet he means the 20th century, which ends at midnight,
Dec. 31, 2000. Or is that midnight, Jan. 1, 2001? Anyway,
right after 23:59:59, Dec. 31, 2000.

True, but unless you're entering unclaimed territory (rather rare I
presume), you are subject to the laws of the nation that you are
entering. From what I understand, it is not the United States that sets
it's exit requirements, but rather the nation that you are exiting to.

They may even be in the 453/460 range. There are a bunch in that range in
the Michigan area.
They're starting to pop up in that area because Nextel is taking over more
& more 850-860 frequencies every day.

I presume then that you don't use landline phones either? Do you drive
a car? Watch TV? Fly commercial airlines? The building trade
associations and unions make political contributions too, so you must
not live in a building of any kind. Be careful, the cave you live in
is probably on government land.

You need to brush up on your US history. Really.

A little reading about the philosophical underpinnings of the founders
would help you too. Look into what was called "The Enlightenment".

Educational and uplifting too.

Of course. In today's junk society, the state has no choice but to issue a license. To deny the license would certainly result in a federal discrimination lawsuit under the ADA.

First of all, the scanners are FOR AUCTION, not FOR SALE.

Secondly, how can you state that they're "cheap" when the auction's outcome
will determine the price?

We can safely snip the rest of your post if it is based upon this flawed premise. Rights are not conveyed or granted to the citizen by the Bill of Rights, rather they are pre-existing and _enumerated_ by the BoR. Do you get that? Rights are not granted, from the Declaration of Independence:

That to secure these rights, governments are instituted among men, deriving their just powers form the consent of the governed.

The Bill of Rights _secures_ these rights, rights which pre-exist, but it most assuredly does not create them.

Further, not all rights are enumerated:

9th Amendment

The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people.

Also, if a power (governments do not have rights, only powers specificly vested by the people) is not specificly vested in government then said government has no business mucking about in that area.

10th Amendment

The powers not delegated to the United States by the Constitution, nor prohibited by it to the states, are reserved to the states respectively, or to the people.

Lastly, if said government does in fact insist on mucking about in areas where it has no Constitutional powers, well, that's what the 2nd Amendment is all about. Well, after the soap, ballot and jury boxes.

Best,
Jim

What they do, as opposed to what they can do are two different issues. Customs officers can enforce all federal laws, and those of the province you are entering. Just because you have never been asked to produce you ham license is no reason to suggest that someone else leave theirs at home when they bring their equipment into Canada. The law does require that they have it, I suspect that that is the case in their home States as well.

......I did NOT recommend leaving your license at home on a trip to Canada.
I merely implied that Canadian Customs (as a rule) simply isn't interested
in enforcing Industry Canada Rules any more then US Customs is in enforcing
FCC rules.
......and you're right... the operator of a US amateur station is required
to have a license in his possession at his 'station' (..before the
nit-picking begins.. in the FCC's eyes, your station is where you are
operating from, be it a car, or your home), just as in Canada.

What it all boils down to is that so long as you use common sense and try to stay within the law, nobody is going to go ape on you and start inspecting your equipment to see if it's legal. However, be sure to have all your documents in order and in hand just in case you do run into trouble.

When you cross the border, you are going into a foreign country, but honestly, you are hard pressed to spot the difference. (Mind you, we are politer in most places and we have stronger beer!)

How about this novel approach. Rather than making everything under
the sun illegal, why not have the police pull people over for wreckess
driving? The police could actually pull their vehicles off the road
from their money making scheme known as speed traps, and they could
join the flow of traffic where they could much better see people doing
stupid things. Then, and this is the good part, they could pull them
over and cite them for wreckless driving.

But I guess this makes too much sense and it's so much more fun to see
us turn into a police state where EVERYTHING is illegal!

Hmm, I took my scanner once on a QANTAS fight to Darwin, and had no
troubles hearing air band communications in the plane. I kept it
hidden so that the flight staff wouldn't see it, and I kept to myself
during the flight when using it. Anyway thats it from me, as you can
bet this thread will get to some huge lenth with doo-gooders saying
how you shouldn't take a scanner on board, and they could interfer
with flight systems etc etc. I've heard all this before, and my plane
didhn't crash and had no problems. Personally I think if they let
people use laptop computers in an plane after take off, then I doubt
the spurious emmissions from a small wide band scanner would be any
where as bad as a laptop. Anyway enjoy the long list of upcoming
flames on this subject. I'm outa here!

Counter=frequency counter, count exact frequency but normally not give
any infomation of field strength
RF detector= give you only field strength information=idicate RF field
to be present but dont give information of frequency.

as far as I know I doubt that any will allow it.
but maybe after flight level has been attained it is a possibilityty since it is only a receiver. there are some however that transmit the cockpit conversations with the tower and ATC but when ever the flight attendant
gets on the P.A. the P.A. overrides that and it is usually at the most interesting times. I have one time snuck my scanner on board and made it so it looked like I was listening to the oon board system when in actuality I was listening to my scanner but due to the skin of the aircraft I want able to get *ANYTHING* not even the aircraft's transmitter. the whole attempt was futile.. but... YMMV

From: Robbin Olson <rolson@mcg.net>
Message-ID: <39f8372b$1@news.mcg.net>
Source record: 77145

I am selling my AOR AR-3000A communications receiver/scanner. Anyone familiar with scanners knows that this is one of the best available. Frequency coverage is 100kHz-2036MHz with NO GAPS! Modes are USB, LSB, CW, AM, NFM, WFM. Search/Scan speed is 50 increments per second maximum. This unit can also be computer controlled via the RS232 port. 400 memory channels. This is an awesome scanner in near-mint condition.

The scanner includes the original manual, A.C. adapter, 12V D.C. car adapter, and an assortment of adapters.

I will also include a wide-band discone antenna (Diamond discone clone) that I have never used. (I have 50 feet of NEW Belden 9913F High-Flex Low-Loss coax (with connectors) that I will include for an additional $35)

I am asking $625 for the scanner and antenna, plus $10 for shipping. YOU WILL NOT BE DISAPPOINTED WITH THIS ONE!

If you have any questions, please feel free to e-mail me.

Thanks.

R. Olson

The answer is that there probably are a few airlines who wouldn't mind as long as you're nice about it. I don't know which Australian ones would or would not permit this. In the US, such activity is allowed at the discretion of the airline's policy, or in some cases at the discretion of the pilot in command.

But any way you look at it, you aren't going to hear much. Remember, you're in what amounts to a great big metal tube with small openings (windows). I doubt you'll pick up much below 800 MHz, and because of the frequency re-use of the high UHF bands, I doubt you'll find much to listen to there.

On the other hand, with an appropriately enabled scanner (check the law first) you may be able to listen to aircraft cellular service. But remember, this depends not just on the laws of the country you board from and land in, but the flag of the aircraft you're flying in.

In my mind, the headache just isn't worthwhile.

Now if you're using private aircraft, this is an entirely different situation. First, you're very likely to be able to hear all sorts of signals. Second, this listening activity is usually allowed so long as the pilot in command doesn't object.

As an airplane owner, pilot, and ham radio enthusiast, I have no qualms about using any sort of radio as long as I'm flying VFR. If I'm flying IFR, I'd have to verify that 1) I've tested that device and configuration in a previous VFR flight, and 2) that I'm not in a critical phase of flight (departure or arrival).

Can someone give me the URL for Electronic Equipment Bank. This electronic store was famous and I come to know about it in Popular Communications a few years ago. I do not know whether this store is still doing business anymore. Last time i've heard that it is located in vienna, VA.

I try to search for the url in the internet but to no avail.

I can't find an active site, but this link - http://www.hamradio-online.com/products3.html - shows a link to http://www.eebradio.com/ as the web site, but it's only a 'placeholder' right now. Maybe they're working on it.

If you want a phone number or other information I suggest a very fast and effiecient search engine - http://www.google.com - I entered the company name you were looking for and "vienna" and quickly found the information above as well as lots more.

WRONG! :-)

See
http://www.delta-air.com/travel/trav_serv/bag_info/Portable_Electronics/index.jsp

You'll see that on Delta, you can use a "VHF scanner" under the same
circumstances that you can use a CD player or laptop computer -- while at
cruise, or while parked at the gate with the aircraft door open.

(Yes, I *know* that that page bans "AM/FM radios" under all circs, and
that most "VHF scanners" include some or all of the functionality of an
"AM/FM radio". Look, I didn't write their rules, and we've heard all of
that debate before. They explicitly allow "VHF scanners". Case closed.)

Alaska Air used to allow them also. They might still -- I can't find
ANYTHING in their in-flight mag or their web site about PEDs these days.

Cool!

Delta allowed scanners for a long time, and last year banned them, per
their in-flight rag. It looks like they've changed the policy back to
allowing them.

jow about:
you TRY to use one on a plane and see how far you get.

The FAR's forbid the use of any electronic equipment
not specifically designed for use on aircraft.

There is a list of "permitted" equipment provided for
in the Flight Aviation Regulations, and scanning recievers
are NOT on that list.

if you want to get arrested, jailed and fined for endangerment
of flight navigation and endangerment to the other passengers,
be my guest. just don't say you weren't warned.

I have hooked up 30+ car radios in a display board to a single antenna. I used a good antenna amplifier and they worked fine. I would expect the same results if you used a good antenna and feedline, split among a few scanners. You are obviously going to loose some signal but a scanner preamp should offset the loss.
I am sure you will get some "birdies" as there will be mixing between the scanning radios.
Bob

When approaching the customs office at the Canadian border they will ask
you one question:
Q: Citizenship?
(Answer this question in the following manner)
A: Goddamit, I am an American! I have no guns under my back seat, there
isn't some guy named Kwong in my trunk and I haven't swallowed any
condoms full of cocaine!

I think its safe to say that illegally modified radios will be the last
thing on the customs officer's mind after this. The downside is that
they will probably probe your anus with a very large a drumstick.

Enjoy your stay in Canada.

MC

Recently I bought a AR8200MkII.

I use it with the stock telescoping antenna but dislike the constant shortening and lengthening of it.

Will a different antenna might help with the reception?

I listen mostly to VHF & UHF but will prefer a fixed length antenna.

A friend recommended the Comet CH-701X

Can somebody help with this?

Thanks

If you have an antenna outside, you could be receiving skip from just about anywhere - only way to ID it is to catch a callsign or something off the air.

You can try

http://www.perconcorp.com/datafinder/index.html

to look up the frequency on the net - you may find something on it.

Perhaps it's worth the wait, but 8 months to debug the firmware?

Has anyone had this happen yet...
My 245 was doing just fine until the san diego city type 2 system went into failsoft on thursday morning. The radio automatically went into the keylock mode...and stayed! No Keypad control whatsoever. I had to do a full reset to get the radio back in service. It's the newest firmware.

Another note...
I own 2 BC245's with the same firmware. Both radios like to resume scanning on their own *sometimes* when in manual mode on type 2 systems. There seems to be no pattern except being locked down for over 3 minutes. I am in areas with pretty solid control channels when this happens. I do get some squishing from pagers around town but this seems to happen in areas where I don't get overloading and when it *does* take out a control channel I can tell because the radio starts searching for the data channel. I have two 45watt maxtrac's in U and V onboard and I have not ruled them out yet. The BC-245 are on batteries when this happens...so power should not be an issue.

Ok..anyone else notice these problems yet. Or does anyone have an educated guess? Before you just shoot from the hip...reread the symptoms in the post a few times.

You probably need to do a discriminator tap. I suspect that the audio filtering may be better on the PRO-2006 and therefore kills the digital signal.

You're going to love the Pro-39. I've had one for several years and it's the toughest unit I've ever had. Don't have any accessories to sell, but do recommend you get one of those telescoping antennas (about $10) instead of using the one that comes with the radio. Radio Shack sells them. I also got an external speaker that plugs into the headphone jack. Helps clear up the audio considerably. Good luck with your scanning.

I recently inherited two Radius SP50's (two way radios). Nothing in the spec's gives any indication as to freq. range ie blocks, miles etc. I did check motorola.com, they do have the radio's on the web page along with spec's, however, no mention of RX/TX range. Any idea? also, are these units worth anything although, I would probably just keep them for toys for my radio collection. Thanks for your help.

The restrictions for Cell phone are primarily due to problems that
the network can encounter.

Scanners are up to the aircraft operator.

And that response is STILL wrong.

It's legal if the aircraft operator (which in the case of commercial
aircraft == the airline) allows it. At least one (Delta) does. That web
site again:

http://www.delta-air.com/travel/trav_serv/bag_info/Portable_Electronics/index.jsp

This has been discussed at length before. The relevant FAR starts out by
banning *all* personal electronic devices, except for a few things like
pacemakers (whew!), digital watches, and so on -- but then goes on to say
that any PEDs that the operator of an aircraft has determined to be safe
to use, may be used.

Delta has made this determination for scanners as well as for the usual
list of laptop computers, portable CD players, and so on.

I didn't think a user was so brainwashed and conditioned that they couldn't think laterally. It's a pity you and many others fall into this category. I see that the "Sheep herd" mentality in this NG still hasn't changed .. oh well.

The fact is .. NO SINGLE PERSON is responsible for the off-topic garbage and foul nonsense in this NG - many people are, and they continue to perpetuate it deliberately & mindlessly.

Simply pointing the finger at John Mackey is simply "parroting" what all the other troublemakers provoke one into doing. It becomes like a private "bashing club" resulting in frustration from the victim - John Mackey - who goes out on a limb to DEFEND himself from imbeciles like yourself.

John Mackey's outbursts are justified from sheer FRUSTRATION and are not intented to cause disruption. Can't you & the rest of your Cheek-clowns comprehend this ? It's simple logic.

I'm just stating things the way I've seen them in this NG for the past four years. No amount of bogus & selective archive postings from deja.com or elsewhere is going to convince me otherwise.

Correct.

Eric also wrote:

> The FAR's forbid the use of any electronic equipment
> not specifically designed for use on aircraft.

Not outright, they don't. See below.

> There is a list of "permitted" equipment provided for
> in the Flight Aviation Regulations, and scanning recievers
> are NOT on that list.

True, but they don't need to be. Laptop computers aren't on the list
either.

Here's the relevant reg:

TITLE 14--AERONAUTICS AND SPACE

PART 121--OPERATING REQUIREMENTS: DOMESTIC, FLAG, AND SUPPLEMENTAL
OPERATIONS--Table of Contents

Subpart K--Instrument and Equipment Requirements

Sec. 121.306 Portable electronic devices.

(a) Except as provided in paragraph (b) of this section, no person
may operate, nor may any operator or pilot in command of an aircraft
allow the operation of, any portable electronic device on any U.S.-

registered civil aircraft operating under this part.

(b) Paragraph (a) of this section does not apply to--

(1) Portable voice recorders;

(2) Hearing aids;

(3) Heart pacemakers;

(4) Electric shavers; or

(5) Any other portable electronic device that the part 119 certificate holder has determined will not cause interference with the navigation or communication system of the aircraft on which it is to be used.

(c) The determination required by paragraph (b)(5) of this section shall be made by that part 119 certificate holder operating the particular device to be used.

[Doc. No. FAA-1998-4954, 64 FR 1080, Jan. 7, 1999]

This by the way is from
http://frwebgate.access.gpo.gov/cgi-bin/get-cfr.cgi?TITLE=14&PART=121&SECTION=306&YEAR=2000&TYPE=TEXT
, just in case anyone wants to make sure that I'm not making this up. If you want to see more context, try this link:
http://www.access.gpo.gov/nara/cfr/waisidx_00/14cfr121_00.html
and click on the "121.306" link from there.

Note that, yes, paragraph (a) starts out by banning ALL PEDs. But anyone who thinks that that constitutes an outright ban on scanners, needs to keep reading, for it leaves a loophole in the form of paragraph (b), which includes clause (5): "ANY other portable electronic device that the part 119 certificate holder has determined will not cause interference..." If you'll go to
http://www.access.gpo.gov/nara/cfr/waisidx_00/14cfr119_00.html (that's part 119), you'll see that the "part 119 certificate holder" is the airline.

Anyone who thinks that this reg bans scanners outright needs to explain to me why laptop computers and portable CD players aren't banned too -- since they aren't on the list of excepted devices in the reg, any more than are scanners. They don't need to be, because the airline can test them (or trust someone else to test them) and say "yep, they're cool." Most airlines have done this for laptop computers. Delta has done it for scanners.

I don't think soooooo
Maybe you don't get around the prez or vp much...I do...Radio's crash all the time and that sends everybody into the clear until they get rekeyed. You sure as hell don't attempt rekeys during critical portions of a visit. Can't say I ever heard the 400mhz Spread spectrum in the clear...but I get plenty of vhf and vhf lowband ops in the clear depending on the function . The WHCA has a pretty impressive setup that tails with a very cool van and a ryder type truck packed with radios of every type.

I used a scanner on a Delta flight (with permission) and I was surprised how much was heard in the 150 MHz range. I heard a lot of police stuff, though each one was just for a short time. (Those planes cover a lot of ground, ya know.)

There is a HAM in my area who is also a pilot for a major airline. From what I've heard, he takes a small rig with him to chat with other HAMs on the ground. It's rather difficult to see how a scanner would cause problems, when he's transmitting from the cockpit! ('Course, he's also got the instruments in plain view -- he'd know if there were a problem.)

I did this a few months back and found there were literally THOUSANDS of matches for "Eric Oyen" on DejaNews. They go back about 5 years. All sorts of personal squabbles, off-topic postings, etc.

How does a guy who is supposively "blind" able to post all this rubbish on USENET?

Well Mr. "EXPERT", never underestimate the power and will of the people. All you have to do is watch the various news medias. Your subject was mentioned on FOX. By the way, "analog" cellular phones are not obsolute yet, they are in the process of being replaced with digital.

Thank you for "YOUR" - "OPINION"
